## PREFACE

The Canada Year Book has interpreted for Canadians and the world at large the resources, institutions, and social and economic conditions of the nation since Confederation, but it is during relatively recent times that this publication has developed into the broad medium of information it has now become.

This development had its roots in the reorganization of statistics that resulted from the Report of the Commission on Statistics in 1912 and the consequent establishment of the Dominion Bureau of Statistics, under the Statistics Act of 1918, to carry out the recommendations of the Commission. It was from this time that a really co-ordinated national system of statistics began to take shape.

The high place that the Canada Year Book has won for itself among official statistical reference works hinges largely on the developments that have taken place since 1918. As improved and more complete statistics have become available with the growth of the Dominion Bureau of Statistics, the editorial policy of the Year Book has been to keep pace by presenting the salient statistics of the country against a background of textual analysis intended to bring out their relationships and significance.

Each year special feature material is introduced that is of current interest. Such feature articles are made available in 'reprinted' form (see p. xiii) and constitute a valuable backlog of reference material on most phases of national development. With the entry of Newfoundland into the Canadian Confederation it appears desirable that special articles of a general nature, such as those dealing with physiography, resources, wildlife, etc., should be brought up to date as early as possible and this edition of the Year Book carries topical articles on: Geology (pp. 14 to 26); Migratory Bird Protection (pp. 38 to 43); Soil Zones, Agricultural Irrigation and Land Conservation (pp. 352 to 356 and 367 to 379); and the Forest Economy (pp. 425 to 437). The Terms of Union under which Newfoundland became a Province of Canada are given at pp. 56 to 57. A special article on the Frequency Standardization Program now being undertaken by the Ontario Hydro-Electric Power Commission appears at pp. 540 to 548. The article has been prepared under the direction of the Chairman of the Ontario Hydro-Electric Power Commission. A special article dealing with the Indians of Canada—describing the history of this people, their administration, and the welfare work being carried on among them—will be found at pp. 1125 to 1133.

Statistics for Newfoundland are gradually taking their place in the regular chapter material, although it is still necessary to present them separately from those of other provinces in several chapters because of existing lack of comparability. The Census of 1951 will do much to establish the ten provinces on a uniform basis, statistically.

The regular chapter material has been kept up to date. The reorganization of the Department of Mines and Resources during 1950 and the transfer of its administrative functions to three new departments, viz., the Department of Mines and Technical Surveys, the Department of Resources and Development and the Department of Citizenship and Immigration, has necessitated revised treatments of the corresponding sections of the Year Book. Thus, because of present close administrative relationship between immigration and citizenship, the Immigration

Chapter has been extended to cover all matters affecting citizenship that formerly came under the Secretary of State, and the new Part is introduced by material on Early Naturalization Procedure and Events Leading up to the Canadian Citizenship Act (pp. 153 to 155).

Canada's Ninth Census (1951), for which arrangements are now being completed, will constitute the most comprehensive stock-taking of the nation that has yet taken place. Statistically, it will provide a tie-in for a wide range of important national surveys that during intercensal years were conducted on a 'sample' basis. The 1952 and 1953 editions of the Year Book will carry extended analyses from the 1951 Census. In the meantime the Chapter on Population (Chapter IV) is reduced to skeleton proportions.

The Production Chapters of the Year Book (Chapters XI to XVIII, inclusive) continue the story of the steady expansion of the Canadian economy. Canada's favourable position as a primary producer; the variety and extent of its resources (now augmented by the fishery, forest and mineral resources of Newfoundland); and the outstanding development of its manufacturing facilities and industrial equipment are all traced in the record. Chapter XV—Mines and Minerals—is prefaced by special descriptive text summarizing the significant events that have lately characterized developments in this important field.

The Introduction to the current edition serves to highlight the major events of the year. The real value of this Introduction lies in the co-ordination of major trends developed in the chapter material and in linking these together in relation to administrative policy. The chapters deal with their respective subjects separately and in detail, whereas the Introduction presents to the reader a picture of the national economy as an organic whole, cemented by the purposeful direction that policy is giving to the national effort in the current period of international tension.

The appendices at the end of the volume serve to bring up to date certain sections of the Year Book, which in chapter form were closed for press early in the year. Appendix I brings the Chronology (Chapter II) up to the end of February, 1951. The latest figures on Foreign Trade are given in Appendix III and comparative expenditures for the First and Second World Wars, in Appendix IV.

The process of revising all sections of the Year Book has been carried out in collaboration with the most competent authorities.

Acknowledgments are hereby tendered to the numerous officials of the Federal and Provincial Governments, and to others who have contributed material. Wherever possible, credit is given to the persons and various services concerned by means of footnotes to the respective sections.

The present volume has been edited by A. E. Millward, Director, Canada Year Book Division, assisted by the Year Book Staff. Charts, graphs and layouts have been made by or under the direction of J. W. Delisle, Senior Draughtsman of the Bureau.

With a view to the improvement of future editions, the Bureau will be glad to hear of any errors that may have escaped notice and to receive suggestions with regard to omissions or to methods of treatment.

HERBERT MARSHALL,

Dominion Statistician.

DOMINION BUREAU OF STATISTICS,

OTTAWA, Mar. 1, 1951.

# DISTANCES BETWEEN PRINCIPAL POINTS IN CANADA \*

NOTE.—Generally, the distances given are the shortest by railway.

A knowledge of distances in miles between principal points constitutes very useful information in these days of wide travel, but when an attempt is made to compile such data difficulties are at once encountered. Railway distances are the logical choice, even though road distances are of increasing interest to a vast body of travellers by automobile and are a useful alternative. Again, distances by air (sometimes called 'be-line' distances) are only useful in practice to those who travel by air. This is a growing phase of transportation, of course, but has not yet assumed such proportions that its tabulation should displace the more usual one. Again, it is not a difficult matter to estimate air-line distances from a map made to convenient scale, whereas the ordinary reader is not able to obtain railway distances easily.

Even though it be decided to adopt railway distances as most useful, it is necessary to decide whether the most travelled route between two places or the shortest railway route should govern. In the tables given below, the distances between points are the shortest distances by railway and not necessarily the most travelled routes or the routes by which main trains travel. They are compiled principally from the railway time tables. The main table includes the capital of each province and some of the main shipping points chosen principally, but not altogether, by population; the subsidiary tables include distances of local importance. Included in the distances from Charlottetown is the distance from Charlottetown to Cape Tormentine, over which the trains are transported by ferry; similarly, the train ferry distance between Mulgrave and Point Tupper is included in the distance from Halifax to Sydney. In the main table all the distances from Victoria include the distance travelled by boat from Victoria to Vancouver. However, wherever possible, railway distances only are used. In certain distances from Three Rivers and from Quebec it is possible, by the use of ferries, to travel by shorter routes than those given in the tables, the rail route only being taken in these cases.

Where boat routes are given, the best approximation of the distance travelled is used.

The air-line distances used are not necessarily the straight-line distances between points, but are the distances over the routes usually travelled by aeroplanes in good weather.

The air-line distances used are not necessarily the straight-line distances between points, but are the distances over the routes usually travelled by aeroplanes in good weather.

# ARTICLES AND MISCELLANEOUS TEXT MATERIAL (PUBLISHED IN FORMER EDITIONS) CLASSIFIED BY SUBJECT

NOTE.—It is not possible to include in any single edition of the Year Book all articles and descriptive text of previous editions, and the following list has been compiled as an index to such miscellaneous material and special articles as are not repeated in the present edition. This list links up the 1951 Year Book with its predecessors in respect to matters that have not been subject to wide change. Those sections of chapters, such as Population, which are automatically revived when new material is made available from a later census and to which adequate references are made in the text, are not listed unless they are in the nature of special contributions. The latest published article on each subject is shown, except when an earlier article includes material not repeated in the later one. When articles cover more than one subject they are listed under each appropriate heading.

## WEIGHTS AND MEASURES AND OTHER INTERPRETATIVE DATA

In Canada, as a rule, the imperial system of weights and measures is followed. An exception, however, is the ton where, unless otherwise stated, the short ton of 2,000 lb. is meant.

The following table shows the weights and measures used in Canada in connection with the principal field crops and for wheat flour and fruits:—

	<i>Pounds per Bushel</i>		<i>Pounds</i>
<b>Grains—</b>		<b>Fruits (standard conversions)—</b>	
Wheat .....	60	Apples, per barrel .....	135
Oats .....	34	Apples, per box .....	43
Barley .....	48	Pears, per bushel .....	50
Rye .....	56	Plums “ “ .....	50
Buckwheat.....	48	Cherries “ “ .....	50
Flaxseed.....	56	Peaches “ “ .....	50
Corn.....	56	Grapes “ “ .....	50
Mixed grains.....	50	Pears, per box.....	42
All others.....	60	Strawberries, per quart.....	1·25
<b>Wheat Flour—</b>		Raspberries “ “ .....	1·25
1 barrel equals 196 pounds and approxi- mately 4·5 bushels of wheat are used in the production of a barrel of flour.		Loganberries “ “ .....	1·25

### Relative Weights and Measures, Imperial and United States

The following tables of coefficients may be used to translate amounts expressed in one unit to the other.

1 Imperial pint=20 fluid ounces.	1 Imperial proof gallon=1·36 United States proof gallon.
1 United States pint=16 fluid ounces.	1 Short ton=2,000 pounds.
1 Imperial quart=40 fluid ounces.	1 Long ton=2,240 pounds.
1 United States quart=32 fluid ounces.	1 Barrel crude petroleum = 35 Imperial gallons.
1 Imperial gallon=160 fluid ounces.	
1 United States gallon=128 fluid ounces.	

### FISCAL YEARS OF FEDERAL AND PROVINCIAL GOVERNMENTS

The Federal Government fiscal year ends on Mar. 31.

The dates on which the fiscal years of the provinces end are as follows:—

Newfoundland.....	Mar. 31	Ontario.....	Mar. 31
Prince Edward Island.....	Mar. 31	Manitoba.....	Mar. 31
Nova Scotia.....	Nov. 30	Saskatchewan.....	Mar. 31
New Brunswick.....	Oct. 31	Alberta.....	Mar. 31
Quebec.....	Mar. 31	British Columbia.....	Mar. 31

Throughout the Year Book, fiscal-year figures are so indicated in the text and headings of tables; in all other cases figures are for calendar years.

## STATISTICAL SUMMARY OF THE PROGRESS OF CANADA, 1871-1949

In connection with the summary that immediately follows, certain qualifications apply to the figures for early years where the basis of calculation or the series themselves have been modified. The details appear in all earlier editions of the Canada Year Book and specifically at page xv of the 1950 edition.

Area of Canada, including Newfoundland which entered Confederation in 1949, is 3,845,144 sq. miles. The land area is 3,499,116 sq. miles and the fresh water area 234,028 sq. miles (excluding Labrador, not surveyed).

The length of the Canada-United States Boundary is 3,986.8 miles and that of the Canada-Alaska Boundary is 1,539.8 miles. The total mainland coast line of Canada (not accurately computed) is estimated at 17,863 miles.

# STATISTICAL SUMMARY OF THE PROGRESS OF CANADA

NOTE.—The interpretation of the symbols used in the tables will be found facing p. 1 of this volume.

<sup>1</sup> Figures are subject to revision.

<sup>2</sup> These are intercensal estimates and will be adjusted after the next census.

<sup>3</sup> Quinquennial census figures.

<sup>4</sup> Exclusive of the Territories.

<sup>5</sup> Year ended Mar. 31.

<sup>6</sup> By place of occurrence prior to 1941; by place of residence 1941-49.

<sup>7</sup> Includes Newfoundland.

<sup>8</sup> These

figures are not completely comparable owing to change in classification in 1938.

<sup>9</sup> For reporting hospitals

## STATISTICAL SUMMARY OF THE PROGRESS OF CANADA—continued

NOTE.—The interpretation of the symbols used in the tables will be found facing p. 1 of this volume.

were given of factory butter and cheese; quantities have been calculated by reckoning cheese at 10 cents per lb. and butter at 25 cents per lb.

<sup>1</sup> Data shown for 1946-49 represent cheddar and other cheese made from whole milk; prior to 1942 the figures include other cheese for Quebec only.

<sup>2</sup> Prior to 1921 this item does not include skim milk and buttermilk.

<sup>3</sup> Includes Newfoundland.

<sup>4</sup> Fiscal years prior to 1931.

<sup>5</sup> Years ended Sept. 30.

<sup>12</sup> Since 1924 the net value of production is computed by subtracting the cost of fuel and electricity

## INTRODUCTION

### Canadian Economic Developments in 1950-51

#### International Developments

The outstanding event of the twelve months under review was the Korean incident, which began on June 25, 1950. For Canada and other democratic allies this date marks the beginning of a new period, with defence preparation becoming the major economic determinant. Other significant developments were a strengthening of the earlier upturn in activity in United States, an improving outlook for foreign markets generally even before Korea, and a strong inflow of foreign capital, particularly the influx of short-term funds which reached a peak in September. With activity already at a high level in Canada, the combined effect was a resurgence of inflationary pressure. Material shortages began to be felt before the end of 1950, and by early 1951 were growing in number and intensity.

The first half of 1950 was characterized in Canada by a generally sustained level of activity with some upward movement in prices. Employment remained fairly stable on the whole, but unemployment had increased and threatened to become a problem in some areas. Meanwhile the 1949 recession in the United States proved to be essentially a matter of inventory adjustments, and by the end of the first quarter of 1950 the prospects there for industrial production and employment were improving steadily. The Canadian economy had felt little of the effects of that recession, but its termination nevertheless gave renewed assurance of continued or increasing prosperity with relatively little slack in productive capacity.

After the invasion of South Korea, the leading nations of the democratic world intensified their defence preparations. One result was an augmented world demand for several of the basic commodities of which Canada is a major supplier. Canada's own defence program was enlarged and, with the further mounting of international tension, its scope was widened to an extent never before contemplated except in time of all-out war. Defence expenditures are projected at \$5,000,000,000 over the next three years. The actual increase in defence production was not great even well into 1951, but these demands were imposed at a time when activity was high and on an upward trend, and the forward impact of the preparedness program as a whole had a widespread influence in the economy.

Foreign capital continued to finance an important part of Canadian investment, as in other recent years. The inflationary tendency of such an inflow was not serious until speculative funds began to be attracted in the anticipation that an exchange adjustment would become necessary in the near future. This influx during the summer months threatened an unwarranted expansion of bank credit, a result that was avoided only by extensive open-market operations in securities by the Bank of Canada. The flow reached such proportions in September as to require decisive action, so on Sept. 30 the fixed exchange rate for the Canadian dollar was abandoned. The immediate effect was to stop the inflow of speculative funds, or at least to reduce the overall inflow of capital funds to a level compatible with real investment. The Canadian dollar appreciated fairly steadily, and by mid-March of 1951 was quoted at about 95.6 cents United States as against the earlier fixed rate of 90.9 cents.

The free exchange rate for the Canadian dollar has had no effect on trade that can be isolated statistically, coming after an upturn in foreign demand and when the indirect effects of rearmament were strengthening that demand. The higher rates do mean relatively cheaper imports and lower export prices than otherwise would have obtained, but in most cases this effect has been obscured by rises in international prices.

The value of Canada's foreign trade in 1950 reached record levels, with the value of imports increased considerably over 1949 and exports slightly higher. Overseas exports declined but those to United States rose sharply. Closer trade balances were experienced with both the United States and the Sterling Area. With the inflow of foreign capital, reserves of United States dollars showed a substantial increase.

The sharp rise in the world prices of raw materials that accompanied these developments was felt in Canada through export demands and import requirements. Domestic demand in turn was stimulated by rising incomes, intensifying the inflationary pressure in the economy. The cost-of-living index on a 1935-39 base rose from 161.0 in January, 1950, to 172.5 in January, 1951, while the wholesale price index on the same base rose from 199.9 to 233.8 in this period.

The final effect of the various developments can be summarized in terms of the gross national product, the value of all goods and services produced in Canada. This value is estimated at \$17,700,000,000 for 1950, an increase of about 8 p.c. over the previous year. About half of this increase was due to increased volume of output and the other half to higher prices. Demand strengthened in all the expenditure sectors: the value of consumer purchases was greater by over 6 p.c. than in 1949, government purchases over 9 p.c., gross home investment 27 p.c. and exports of goods and services nearly 5 p.c. Imports of goods and services purchased out of these expenditures increased in value by about 17 p.c. and in fact exceeded the value of the corresponding export item by some \$300,000,000, the first such excess in several years. Among the various claimants on the gross national product, only agriculture suffered a decline in net income from 1949, amounting to nearly 6 p.c., largely the result of low grades from frost damage to the western grain crop. The net income of other unincorporated business increased by over 5 p.c., the net income of salary- and wage-earners by over 6 p.c. and investment income by over 20 p.c.

### **Economic Aspects of Defence Preparedness**

During 1950, contracts for military equipment, supplies and construction projects to the value of \$629,000,000 were placed by the Canadian Commercial Corporation on behalf of the Department of National Defence. This is in addition to approximately \$31,000,000 spent on married quarters and similar projects for the services by Central Mortgage and Housing Corporation. The acceleration of the preparedness program is illustrated by the fact that first quarter contracts for defence materials amounted to \$56,000,000, second quarter \$88,000,000, third quarter \$132,000,000 and fourth quarter \$318,000,000. Further increases are in sight for 1951.

A new crown company, Defence Construction Limited, was established to take over all defence construction projects and so free the Canadian Commercial Corporation of this part of its growing burden. The new company has an arrangement with Central Mortgage and Housing Corporation by which the latter provides engineering and other services required for carrying out the federal defence construction program.

Early in 1951 a Department of Defence Production was established to meet the need for a further expansion of defence procurement organization. The duties of the new Department parallel those of the former Department of Munitions and Supply. The Department will have three main branches to deal with materials, production and procurement. Under the Coordinator of Materials will be divisions responsible for steel, base metals, petroleum, chemicals and priorities. Under the Coordinator of Production will be divisions responsible for motor-vehicles, machine tools, guns and ammunition, aircraft, electronics, shipbuilding and construction. The procurement branch will take over most of the work and personnel of the Canadian Commercial Corporation. Many of these divisions were established and began functioning under the Department of Trade and Commerce in anticipation of the new organization.

Canadian defence production is being developed in close co-operation with all North Atlantic Treaty nations, and particularly with the United States. Co-operation with that country assumes added importance with the decisions of the Armed Forces to standardize on United States types of equipment.

Canada and the United States signed an agreement on Oct. 26, 1950, recognizing a Statement of Principles for Economic Co-operation, a revitalization of the principles of the Hyde Park Agreement of the Second World War. Already by mutual arrangement Canada is buying substantial quantities of war equipment in the United States, and that country is reciprocating by placing war contracts in Canada. Important arrangements have been made respecting the allocation of scarce materials, particularly steel. Each country is extending to the other a similar priority to that extended to its own defence orders. Canada has been included in United States allocations of steel for such essential programs as the building of railway cars, ships and locomotives and for the steel warehouse trade.

Within the North Atlantic Treaty organization, more generally, the basic principle is for the most efficient producers to contribute as fully as possible to the requirements of member nations. On items for large-scale production, members confer with the military authorities of the organization as to the acceptability of the product. Canada is represented on the organization's Defence Financial and Economic Committee, the Defence Production Board (successor to the Military Production and Supply Board, with wider powers), and on a committee to decide on standard types of weapons to be recognized as such by all member countries. The decision to standardize on American-type equipment has enabled Canada to make available to Europe British-type equipment no longer required, as fast as replacements can be provided.

The Canadian Government has restricted the export of a number of essential materials in order to conserve domestic supplies. In September of 1950 the scope of this control was widened to provide closer co-operation with United States in controlling the volume and destination of strategic materials, without impeding the freedom of flow between the two countries themselves. This increased the number of products under export control from 91 to 186 at the end of 1950, with area control extended from 64 to 70 countries.

Some indication of the impact of defence purchasing on civilian production can be had from the following classification of contracts awarded in 1950:—

	\$		\$
Aircraft.....	267,000,000	Textiles and clothing.....	24,000,000
Armament, ammunition and military vehicles.....	116,000,000	Industrial equipment, scientific, medical, and testing apparatus and miscellaneous.....	35,000,000
Shipbuilding.....	74,000,000	Defence construction.....	35,000,000
General stores.....	41,000,000		
Electronics and communication equipment.....	37,000,000		

Defence spending has not increased as rapidly as the awarding of contracts. Some contracts are speedily fulfilled, but others take a year or more to be completed. Hence it will be well into 1951 before the full physical impact of defence orders is felt. In some respects the impact already has been anticipated to a large extent. For example, world markets for commodities such as rubber, tin, wool and cotton probably reflect anticipated demand as well as present demand. Defence expenditures in 1950 accounted for about 5 p.c. of the Canadian gross national product. This proportion is expected to rise to 8 or 9 p.c. for 1951 and may be even greater in the final months of the year.

Although it was possible even well into 1951 to place defence contracts without any material expansion of industrial facilities, it became apparent at an early stage that such expansion would become necessary in many fields. It is to be expected that these investments will be privately financed for the most part. To encourage favourable decisions in cases that otherwise would be doubtful, Order in Council P.C. 816 of Feb. 13, 1951, provides for accelerated depreciation of investments for defence and related purposes where the needed facilities will have a greatly reduced peacetime value. Meanwhile considerable developments are under way in such fields as steel, copper, lead, nickel and tungsten, while a substantial expansion of aluminum capacity has been under consideration. The crude oil pipe line from Edmonton to Superior was completed in 1950, and spurs to Winnipeg and Moose Jaw are to be completed in 1951. A duplicate pipe line from Portland to Montreal is well advanced and is expected to be completed in 1951 also. Heavy investment continues in the western oil fields and in the expansion of storage and refinery capacity, and product pipe lines are projected from Sarnia and from Montreal to Toronto. The government-owned Polymer Corporation is increasing its capacity to produce synthetic rubber, the Eldorado Mining and Refining Corporation its facilities for the production of uranium, and the National Research Council is constructing a new and larger atomic pile to produce plutonium.

The building up of production facilities is one of the most important aspects of preparedness and the nation's investment program is therefore of particular concern. The volume of investment set a new record in 1950, with the value of private and public capital expenditures amounting to approximately \$3,800,000. A survey of investment intentions for 1951 indicates plans totalling over \$4,200,000. But it is investment of all kinds that will feel the main impact of the preparedness program, including in fact the larger units of consumer capital (such as motor-cars and household equipment, not covered in the survey). Preparedness will require pressing forward with such developments as those related to oil, metals and power and with investment necessary for defence production, but in other sectors there will have to be a substantial scaling down of programs.

The first direct moves in this direction were orders prohibiting the use of steel rolling-mill products in the construction of amusement or recreation facilities, office buildings, hotels, printing establishments, banks, personal-service establishments, retail stores, wholesale establishments for consumer goods, and other specified types of construction. The use of rolling-mill products was prohibited also in the merchandising, storage, manufacturing or processing of any liquors, spirits, beers or wines, in the manufacturing or processing of tobaccos, cigarettes, cigars, carbonated beverages or confectionery other than bakery products, and in outdoor advertising signs. The Government has given warning that further restrictions are to be expected.

The orders restricting the use of steel were imposed under the authority of the Essential Materials (Defence) Act of 1950, passed in anticipation of the fact that control over critical materials would be required in due course. Another order established a formal system of steel priorities for defence orders and defence-supporting projects. Supplementing these orders are voluntary arrangements with the steel mills to distribute supplies equitably among their established customers, and various arrangements with the United States relating to the allocation of steel and other scarce materials.

It is to be noted that the initial controls affecting steel are not primarily for the purpose of assuring supplies for defence contracts, that these contracts by themselves do not require a particularly large proportion of the steel available. The main purpose is rather to meet the requirements of defence-supporting projects, such as the building of railway cars, locomotives and ore carriers to move essential materials and supplies. While technically not defence orders, these are no less essential to preparedness than the production of guns.

The pressure of the preparedness program on supplies has led to some inflationary pressure on prices. The Essential Materials (Defence) Act of 1950 authorized the executive to control prices on materials required for defence purposes. This was followed in March, 1951, by the Emergency Powers Act, conferring a more comprehensive authority to carry out adequate defence preparations and to regulate the economy of Canada, including authority to regulate trade, production and manufacture, and to impose price or other controls.

The Government has taken the view that price controls are more effective if complementing more fundamental anti-inflationary measures of a fiscal and monetary nature. Such policies have been put into effect. The Bank of Canada's action to neutralize the inflationary effects of the speculative influx of foreign capital in 1950 and the freeing of the exchange rate have been mentioned above. The subsequent appreciation of the Canadian dollar and the removal of import restrictions have had an anti-inflationary influence. On Feb. 22, 1951, the Bank of Canada announced that arrangements had been made with the chartered banks to prevent bank loans and non-government investments from rising above present levels; among other things, margin requirements on securities were increased, lending policy on commercial and personal loans was tightened, and the expansion of loans on the security of instalment finance paper was halted. Consumer credit had been brought under direct control by the Consumer Credit (Temporary Provisions) Act, 1950. The initial regulations under this Act became effective on Nov. 1, 1950. Order in Council P.C. 1249 of Mar. 13, 1951, increased the minimum down payment from one-third to one-half the cash price on motor-cars and from one-fifth to one-third of the cash price on a wide range of other products, reduced the maximum credit period from eighteen to twelve months, and made other changes, all effective Mar. 19. The announced intention of the Government is to ensure a fully balanced budget. The Supplementary Budget of September, 1950, raised corporation taxes from 10 p.c. on the first \$10,000 and 33 p.c. on the remainder to 15 p.c. and 38 p.c., respectively, increased the tax on such goods as motor-cars, radios, and jewellery to 23 p.c., increased the tax on alcoholic beverages and levied new ones on soft drinks and candy. The Government has renewed its economy program in all non-defence activities and has moved to reduce the level of postal and some other services provided to the public. It has postponed some of its construction projects. The restrictions on the use of steel will dampen demand not only directly

in construction but indirectly in commercial equipment and related fields. Under the Farm Improvement Loans Act, 1944, Order in Council P.C. 375 of Jan. 24, 1951, shortened the period in which repayments of new loans must be made and in some instances reduced the proportion of a project's cost that might be advanced. The limit on loans from the Government's Central Mortgage and Housing Corporation was reduced from 93·3 p.c. of the lending value to 80 p.c., effective Feb. 5, 1951, and the Corporation has continued to base its lending values on the level of property values existing on Jan. 1, 1950. These measures together with rising building costs have increased substantially the size of the down payment required.

### Other Economic Policies

Federal Government action to influence the level of economic activity has been applied in both the international and the domestic fields. In the latter case the action has been in accordance with the long-run aim of a high and stable level of employment and income. In several important instances it has been developed jointly with the provinces and has sought municipal co-operation as well. The various measures are reviewed in the following five sections.

**Foreign Trade.**—One of Canada's primary and long-term objectives is to promote high levels of international trade on a multilateral basis. At the same time the Government has found it necessary on occasion to adopt more short-run objectives to cushion the economy against adverse external influences, including action to bridge temporary periods of disorganization or to facilitate adjustments to a more permanent change of economic circumstances. Examples of the short-run objectives are foreign exchange control in general, post-war international loans, the import restrictions of 1947, and export controls (which are also an instrument of economic warfare). Actions in this field during 1950 include the freeing of the exchange rate mentioned above, the release of further sums under the earlier United Kingdom loan, the relaxation of import restrictions during the year and their complete abandonment on Jan. 2, 1951, and the further extension of arrangements for the sale of Newfoundland codfish to Mediterranean countries which had been in effect before Confederation.

The pursuit of the long-range objective of increasing international trade during 1950 included active participation in work related to the General Agreement on Tariffs and Trade, the maintenance of trade representatives abroad, and participation in numerous international organizations and commodity agreements. At Torquay in September the third round of negotiations opened for multilateral reduction of tariffs among the various contracting parties and acceding countries under the General Agreement. By the end of the year the contracting parties numbered 32 and the acceding countries seven. The fourth session of the contracting parties was held at Geneva in March, 1950, and the fifth one concurrently with the tariff negotiations at Torquay in November and December. Arrangements for the exchange of most-favoured-nation treatment were signed during the latter part of 1950 with three countries not party to the General Agreement—Venezuela, Ecuador and Costa Rica. The arrangements with the first two replaced earlier agreements that had terminated or been allowed to expire. A special Mission visited European markets to promote sales of Canadian wheat and flour, with most encouraging results. Arrangements were made with Great Britain to reduce British West Indian restrictions on imports from the Dollar Area, effective Jan. 1, 1951.

Information on tariff relations generally and on the Foreign Trade Service will be found in the chapter on Foreign Trade (see pp. 948-957).

The International Wheat Agreement, to which Canada is a signatory, is in its second year of operation. All sales of Canadian wheat under this Agreement during the first year were at the maximum price established. Canada has been active as a member of the Food and Agriculture Organization of the United Nations, particularly on a committee on commodity problems.

Canada was an exhibitor at international trade fairs in 1950 at Milan, Brussels, Chicago, and San Antonio, as well as at the British Industries Fair at London and Birmingham, while nine other Canadian exhibits of various kinds were shown elsewhere abroad. In addition Canada held her own third International Trade Fair at Toronto, and a fourth is to be held in 1951.

The Federal and Provincial Governments have encouraged Canadian importers to buy in Sterling Areas and have provided assistance to United Kingdom businessmen to increase their Canadian sales, in many cases involving new investment here. Extensive assistance has been readily forthcoming from industry. In this connection the Dollar-Sterling Trade Board and its British equivalent, the Dollar Exports Board, have been replaced by a new body, the Dollar-Sterling Trade Advisory Council. The United Kingdom-Canada Continuing Committee on Trade and Economic Affairs, established in 1949, continues in existence as an official liaison body between the two countries. In another field, Canada appointed, in April, 1950, an Advisory Committee on Overseas Investment composed of private businessmen; it submitted a report in September which is now being studied.

The first Commonwealth Conference on Foreign Affairs met at Colombo, Ceylon, in January of 1950, attended by cabinet ministers from seven commonwealth countries. The Conference established a Consultative Committee on South and Southeast Asia, which at subsequent meetings at Sydney in May and London in September drew up what has become known as the "Colombo Plan". This Plan is concerned with the provision of technical assistance as a practical contribution to economic development in the area. Administration of the Plan within Canada will be the responsibility of a new unit established in the Department of Trade and Commerce and known as the Technical Assistance Service.

**Public Investment and Resource Development.**—The Federal Government encourages resource development and other forms of private investment by direct as well as indirect means. Direct encouragement takes the form of fiscal incentives, transportation subsidies, Industrial Development Bank credits and other capital loans, research, the provision of technical services, and practical assistance of all kinds to new firms. The Government's own investment policy is kept flexible so as to ensure that, on the one hand, there will not be unwarranted competition with private investment for scarce resources and, on the other hand, that sound projects can be undertaken when there is need of support in that sector. The co-operation of provincial and municipal authorities along these lines is also sought, to the end that only urgent public projects should be undertaken when private investment is high and that public investment may be increased either regionally or nationally when a serious decline threatens in the level of private investment.

In accordance with these policies, the tendency during the early part of 1950 was for some increase in public investment, with attention to regional and local problems. The more notable implementations concerned the trans-Canada highway and assistance to home building. Eight of the ten provinces entered into agreements with the Federal Government for participation in the highway project and some new construction got under way.

The international situation has brought a complete change of emphasis in the whole field of investment and resource development, as will be apparent from the previous section. In the new circumstances the public investment program has been modified, with cutbacks in all fields not essential to the defence effort. In the field of private industry also, the administration of the regulations on the use of steel places the emphasis on essential investment.

**Housing.**—During 1950 approximately 92,000 dwelling units were completed in Canada, of which about two out of five were constructed with financial assistance from the Federal Government, principally under the National Housing Act. During the year seven provinces passed legislation enabling participation in joint projects with the Federal Government under provisions of the 1949 amendment to the National Housing Act. The projects provided for relate to land assembly and unit construction for sale or rent. Projects of both types have been undertaken. It is to be expected that 1951 housing starts will be fewer than those of 1950, in the face of reduced availability of building materials, but assurance has been given that housing will receive priority second only to defence.

**Social Security.**—A parliamentary inquiry was held in 1950 into a universal old age pension plan. Following the committee's report, discussions were held late in the year between the Federal and Provincial Governments and considerable progress was reported in efforts to bring a specific plan into early operation.

In February of 1950, the Unemployment Insurance Act was amended in several important respects. The major changes were the provision of supplementary benefits in the first three months of each calendar year under certain conditions, and a widening of coverage to include persons earning up to \$4,800 and to bring lumbermen and loggers under the Act. Increased rates of contribution and of benefits were established and the level of permissive earnings while unemployed was increased.

Since 1948 health grants have been made by the Federal Government. The grants are related to various health activities and are conditional upon provinces making specified outlays in the field. Actual expenditures by the Federal Government amounted to about \$22,000,000 in 1950, and by the end of the year the number of projects dealt with had increased to about 3,000.

**General.**—The Transitional Measures Act was extended last year to Apr. 30, 1951. The Government has indicated that federal rent control will terminate with the Act on that date, although the new Emergency Powers Act would give it authority to re-enter the field should that become necessary. Newfoundland and Saskatchewan already have provincial rent control measures in force, Newfoundland since before entry into union and Saskatchewan since April, 1950. Several other provinces have indicated their intention to institute controls, including Ontario, Quebec, Alberta and Manitoba.

During 1950, agricultural price supports were provided for eggs and butter through the Agricultural Prices Support Board, while cheese and bacon supplied under export contracts received some price assistance by direct appropriation of Parliament.

The policy of granting assistance on the movement of Canadian coal from Eastern and Western mines to Central Canadian markets was continued throughout the year. This assistance has been generally that amount needed to put Canadian coal at the same price level as imported coal in the specific markets. The assistance has usually been paid to the transportation agents with a consequent reduction in the net freight costs. There were no changes throughout the year in the Orders in Council regulating the payment of this assistance. The Coke Bounty Act

(20-21 Geo. V, c. 6) has provided assistance since 1930 on that tonnage of Canadian coal used to make coke and consumed in the production of iron and steel. Particulars of the amounts paid under these methods of assistance to the Canadian coal industry will be found at pp. 869-870 of this volume. Under the legislation recently passed providing for loans to coal producers in the Atlantic Maritime Provinces (13 Geo. VI, c. 29) approval was given to the application of two coal-producing companies.

The Canadian Maritime Commission was authorized to enter into contracts subsidizing the operation of some 40 vessels on Canadian registry, under the authority of P.C. 1334 of Mar. 16, 1950. The contracts were each for a term of one year, and were responsible for bringing the vessels out of lay-up and into service. By the time the first contracts began to expire the improvement in international shipping rates enabled the Canadian vessels to remain fully employed even though their cost of operation is comparatively high.

With respect to the shipbuilding industry, the yards other than those on the Great Lakes have been slow to experience any great improvement in employment. In order to encourage new construction, permission was given for owners to replace vessels acquired from War Assets Corporation with vessels built in Canadian yards, and the Canadian Vessel Construction Assistance Act made special provision for depreciation. At the same time some work has commenced on naval orders, with the full employment effect still to be felt. The position in the lake yards is quite different and presents no problem; they are already booked up for bulk carriers and oil tankers.

In the matter of immigration, administrative amendments have been made to enable an increased volume of desirable persons to be admitted to Canada. Surveys of the possibilities of establishing immigrants were pursued in co-operation with the provinces, and a plan to aid in the cost of transportation went into effect in February of 1951.

During 1950, two royal commissions were holding inquiries. These were the Royal Commission on Transportation and the Royal Commission on National Development in the Arts, Letters and Sciences. The Royal Commission on Transportation completed its studies and submitted its report in March, 1951.

A Federal-Provincial Conference on Constitutional Amendment was held in January, 1950. It established a Continuing Committee of Attorneys-General to develop the subject. Another conference of Federal and Provincial Governments was held in December, 1950, discussing Federal Government offers respecting new tax agreements and old age security, and a provincial proposal for an amendment to the constitution to permit the provincial legislatures to levy an indirect sales tax at the retail level. The conference agreed that the amendments regarding the indirect tax and regarding old age pensions should be drafted by the Department of Justice and submitted to the provincial governments for consideration, that a continuing committee be set up to consider the character of legislation that would be appropriate respecting pensions between the ages of 65 and 69, that the provincial governments would consider the proposal for new tax agreements and indicate their respective positions at a later date, that further deliberations of the Conference on Constitutional Amendment and its Continuing Committee of Attorneys-General be suspended pending consideration of the tax agreements and related matters, but that once these matters have been disposed of the latter Committee resume its deliberations at the earliest convenience of the respective governments.

## PART I.—GEOGRAPHY\*

Canada comprises the whole northern part of the North American Continent with its islands, except the United States territory of Alaska. It embraces the whole Arctic Archipelago between Davis Strait, Baffin Bay and the connecting waters northward to the 60th meridian on the east and the 141st meridian on the west.

Canada is bounded on the west by the Pacific Ocean and Alaska; on the south by the United States; on the east by the Atlantic Ocean, Davis Strait and the dividing waters between Ellesmere Island and the Danish territory of Greenland; northward it extends to the North Pole.

The southernmost point is Middle Island in Lake Erie, in north latitude  $41^{\circ}41'$ . From east to west Canada extends from west longitude  $52^{\circ}37'$ , Cape Spear, Newfoundland, to west longitude  $141^{\circ}$ , the boundary of Alaska. Canadian territory thus extends over  $48^{\circ}$  of latitude and  $88^{\circ}$  of longitude.

The area of Canada is 3,845,144 square miles, a figure that may be compared with that of 3,608,787 square miles for continental United States and Alaska; 2,095,062 the total area of Europe; 2,974,581 the area of Australia; 3,275,510 the area of Brazil; 1,581,410 the area of the Dominions of India and Pakistan (excluding Burma); 88,807 the area of Great Britain. Canada's area is about 28 p.c. of the total area of the Commonwealth.

The sea coast of Canada, one of the longest of any country in the world, comprises the following mileages:—

Mainland—Atlantic 6,111, Pacific 1,579, Hudson Strait 1,245, Hudson Bay 3,157, Arctic 5,771; total 17,863 miles.

Islands— Atlantic 8,677, Pacific 3,979, Hudson Strait 60, Hudson Bay 2,307, Arctic 26,786; total 41,809 miles.

\* Revised by the Geographical Branch, Department of Mines and Technical Surveys, Ottawa.

The Canada-United States Boundary is 3,986·8 miles long and that between Canada and Alaska is 1,539·8 miles.

The St. Lawrence-Great Lakes system of navigable waterways provides ship transportation from the sea into the very heart of the continent. From the Strait of Belle Isle at the northern entrance to the Gulf of St. Lawrence, the sailing distance to the head of Lake Superior is 2,338 miles; from Montreal, Que., to Fort William, Ont., the great Canadian grain-shipping port, the distance is 1,215 miles. Throughout its length the waterways system gives access to a region rich in natural and industrial resources.

These inland waterways are of great benefit to Canada since modern canal systems by-pass the unnavigable portions of the St. Lawrence River, link up the various bodies of water of the Great Lakes and have a great economic influence on the wealth and progress of the nation. There are no tides in these lakes although considerable variation in water levels is sometimes occasioned by strong winds or heavy precipitation. At the Great Lakes ports and harbours, ships load and unload their cargoes to and from all points in Canada.

### 1.—Approximate Land and Fresh-Water Areas, by Provinces and Territories

NOTE.—For a classification of land area as agricultural, forested, etc., see pp. 27-28.

Province or Territory	Land	Fresh Water	Total	Percentage of Total Area

## Section 1.—Physical Geography

From the standpoint of physical features Canada is divided into six natural divisions as follows:—

(1) The Appalachian Region, comprising the Provinces of Prince Edward Island, Nova Scotia, New Brunswick and the Island of Newfoundland, and most of that part of Quebec lying south of the St. Lawrence River, is a hilly or mountainous region and is made up largely of disturbed beds.

(2) The St. Lawrence Region, a lowland belt bordering the St. Lawrence River and extending westward through southern Ontario to Lake Huron, is underlain chiefly by flat or gently dipping strata of Palæozoic age.

(3) The Canadian Shield is a vast V-shaped area of ancient rocks surrounding Hudson Bay, and includes Labrador.

(4) The Interior Plains Region of Manitoba, Saskatchewan and Alberta stretches down the Mackenzie Valley to the Arctic Ocean and is underlain by only slightly disturbed Palæozoic and Mesozoic strata.

(5) The Cordilleran Region, including the mountainous country of the Pacific Coast, is developed on highly disturbed rocks.

(6) The Arctic Archipelago, with which is linked the Hudson Bay Lowland, includes the islands lying north of the Canadian Shield and a broad, flat region, underlain by flat-lying Palæozoic beds, along the southern shore of Hudson Bay.

The physiographic details are discussed in more detail with the geology of each division at pp. 18-26.

Special articles on the Physical Geography of the Canadian Eastern Arctic and the Physical Geography of the Canadian Western Arctic appear at pp. 12-19 of the 1945 Year Book and pp. 9-18 of the 1948-49 edition, respectively.

### Subsection 1.—Hydrographical Features

The hydrographical features of Canada are described in detail at pp. 3-12 of the 1947 edition of the Year Book.

**Lakes and Rivers.**—The fresh-water area of Canada is unusually large, constituting over 6 p.c. of the total area of the country. The outstanding feature is the Great Lakes, details concerning which are given in Table 2. These lakes, with the St. Lawrence River, form the most important system of waterways on the continent and one of the world's most notable fresh-water transportation routes.

### 2.—Areas, Elevations, and Depths of the Great Lakes

Lake	Elevation Above Sea-level	Length	Breadth	Maximum Depth	Total Area	Area on Canadian Side of Boundary
	ft.	miles	miles	ft.	sq. miles	sq. miles
Superior.....	602·23	383	160	1,302	31,820	11,200
Michigan.....	580·77	321	118	923	22,400	—
Huron.....	580·77	247	101	750	23,010	13,675
St. Clair.....	575·30	26	24	23	460	270
Erie.....	572·40	241	57	210	9,940	5,094
Ontario.....	245·88	193	53	774	7,540	3,727

Lake Superior, with an area of 31,820 square miles, is the largest body of fresh water in the world. The International Boundary between Canada and the United States passes through the waters of Lakes Superior, Huron, St. Clair, Erie and

The river systems of Canada, excluding those of the Arctic Archipelago, are best studied by segregating the main drainage basins as shown in Table 4.

## 4.—Drainage Basins

NOTE.—Classified by the Water Resources Division, Department of Resources and Development.

<b>Total</b> .....	<b>1,379,160</b>	<b>Area, Canada Less Arctic Archipelago</b>	<b>3,310,396</b>

<sup>1</sup> Areas are approximate and are exclusive of those portions of the basins of all rivers that lie in United States territory. <sup>2</sup> Includes the Provinces of Newfoundland, Prince Edward Island, Nova Scotia and New Brunswick.

The greater part of Canada drains into Hudson Bay and the Arctic Ocean; the Nelson River drainage is exceptional in running *through* the most arable and the most settled part of Western Canada, but otherwise the rivers of the West, east of the Rockies, run *away* from the settled areas towards the cold northern salt waters and this adversely affects their industrial utility. The Mackenzie, which drains Great Slave Lake is, with its headwaters, the longest river in Canada (2,514 miles) and its valley constitutes the natural transportation route through the Northwest Territories down to the Arctic Ocean. From Fort Smith, on the Slave River, large river boats run without any obstruction down to Aklavik in the delta of the Mackenzie, a distance of 1,292 miles. In Eastern Canada, the Great Lakes and St. Lawrence drainage basin dominates all others and has undergone the greatest development. The St. Lawrence River and the Great Lakes provide a water route from the Atlantic as far as Fort William and Port Arthur, Ont., twin cities situated on Lake Superior and only 419 miles from Winnipeg, Man., the half-way mark in distance across Canada. The main tributaries of the St. Lawrence all flowing south (most of which have lakes available for reservoiring), together with the main river itself, have developed and undeveloped water powers, the economic value of which it would be difficult to over-estimate. Apart from the plains region of the West, the rivers of Canada have a vast power potentiality well distributed over the country. Table 5 gives the lengths of the principal rivers with their tributaries classified according to the four major drainage basins.

#### 5.—Lengths of Principal Rivers and Tributaries

NOTE.—In this table the tributaries and sub-tributaries are indicated by indentation of the names. Thus the Ottawa and other rivers are shown as tributary to the St. Lawrence, and the Gatineau and other rivers as tributary to the Ottawa.

River	Length miles	River	Length miles
<b>Flowing into the Atlantic Ocean</b>		<b>Flowing into the Atlantic Ocean—conc.</b>

## Subsection 2.—Mountains

The predominant orographical feature in Canada is the great Cordilleran Mountain System. The principal named peaks exceeding 11,000 feet in elevation all lie within that system. They are listed at pp. 7-8 of the 1948-49 edition of the Year Book. The general orographical features of the country are shown in the map facing p. 8.

## Subsection 3.—Islands

The islands of Canada are among its most remarkable geographic features. They include the very large group lying in the Arctic Ocean, the fringe of both large and small islands off the Pacific Coast, those of the Atlantic Provinces and Quebec in the Atlantic Ocean and in the Gulf of St. Lawrence, together with the islands of the Great Lakes and other inland waters. The Pacific Coast islands, with the exception of Vancouver Island and the Queen Charlotte group, are small and dot the coast of British Columbia from Dixon Entrance to the southern boundary of the Province. Vancouver Island is 285 miles long and from 40 to 80 miles broad, covering an area of about 12,408 square miles; the mountain range which forms its backbone rises again to form the Queen Charlotte Islands lying farther north. These islands contribute in large degree to the mining, lumbering and fishing industries of the Pacific and, together with the bold and deeply indented coast line, provide a region for superb scenic cruises.

1 Elevation data not available.

On the eastern coast of Canada are the numerous small, rocky islands lying off the coast of Labrador (part of the Province of Newfoundland), the Island of Newfoundland and the island Province of Prince Edward Island, the islands of Cape Breton (an integral part of Nova Scotia), Anticosti, and the Magdalen group (included in the Province of Quebec), and the islands of Grand Manan and Campobello (part of the Province of New Brunswick) in the Bay of Fundy. The Island of Newfoundland is 42,734 square miles in area, Prince Edward Island 2,184 square miles, Cape Breton 3,970 square miles and Anticosti 3,043 square miles. Fishing activities off these eastern islands are important, but agriculture on Prince Edward Island and mining on Cape Breton are the chief occupations of the inhabitants.

Manitoulin Island (1,068 square miles in area), the Georgian Bay islands in Lake Huron, and the Thousand Islands group in the St. Lawrence River at its outlet from Lake Ontario are the more important islands of the inland waters.

Table 6 lists the islands in Canada having an area of over 2,000 square miles.

## Section 2.—Political Geography

Politically, Canada is divided into ten provinces and two 'territories'. Each of the provinces is sovereign in its own sphere, as set out in the British North America Act (see pp. 40-60 of the 1942 Year Book), and as new provinces have been organized they have been granted political status equivalent to that of the original provinces. Yukon and the Northwest Territories with their boundaries of to-day are administered by the Federal Government. The characteristics of each of the provinces and of the territories are reviewed below.

**Newfoundland.**—The Island of Newfoundland lies across the Gulf of St. Lawrence and is the most easterly part of Canada. It is separated from the coast of Labrador by the Strait of Belle Isle, 11 miles across at its narrowest point, and from Cape Breton Island by Cabot Strait, 70 miles wide. It is triangular in shape, the three sides being about 320 miles long, and has an area of 42,734 square miles. Labrador, which, with the Island, constitutes the Province of Newfoundland, is on the mainland and has an area of 112,000 square miles.

The Island of Newfoundland enjoys a temperate climate with cool summers, mild winters and evenly distributed rainfall. The climatic conditions of Labrador are more severe.

The Island is a plateau of low, rolling relief, with its highest elevations in the west where summits in the Long Range Mountains exceed 2,500 feet. Much of the surface is barren and rocky with innumerable ponds and swamps, and there is little land suitable for farming. The river valleys and the west coast are thickly forested and support a thriving wood-pulp industry. The deeply indented coast line has many harbours providing safe anchorage for the fishing vessels that support the important fishing industry. Fishing, mainly for cod, is carried on along the coasts of Newfoundland and Labrador and on the Grand Banks. Both the Island and Labrador have extensive mineral deposits. Iron ore is mined on Belle Island and lead-zinc-copper ore at Buchans in the interior of the Island. The vast iron-ore and water-power resources of Labrador are as yet undeveloped.

**Prince Edward Island.**—This, the smallest province of Canada, is about 120 miles in length, with an average width of 20 miles and has an area of 2,184 square miles. It lies just off the coast east of New Brunswick and north of Nova Scotia and is separated from both provinces by Northumberland Strait, from 10 to 25 miles wide.

The Island is almost trisected by the deep indentations of Malpeque Bay, north of the town of Summerside, and by the mouth of the Hillsborough River at Charlottetown, which nearly meets Tracadie Bay on the north side. Its rich, red soil and red sandstone formations are distinctive features, and no point on the Island attains a greater altitude than about 450 feet above sea-level. The climate, tempered by the surrounding waters of the Gulf of St. Lawrence and yet free from the rigours of Atlantic storms, combined with a fertile soil and sheltered harbours, offers great inducements to the pursuits of agriculture and fishing. The Province is noted for its relative predominance in the fox-farming industry, its lobster canneries, oyster beds, and the production of seed potatoes.

**Nova Scotia.**—The Province of Nova Scotia is 381 miles in length by 50 to 105 miles in width and has an area of about 21,068 square miles. The mainland is connected with the Province of New Brunswick by the Isthmus of Chignecto; the Island of Cape Breton forms the northeast portion. The latter is separated from the mainland by the narrow Strait of Canso and includes the famous salt-water Bras d'Or Lakes.

Nova Scotia is one of the leading provinces in the production of coal. The coalfields are bituminous, of good quality, well adapted to the production of coke and excellent for domestic use and for steam-raising purposes. The chief coalfields are at Sydney and Inverness on Cape Breton Island, and at Pictou and Cumberland on the mainland.

On the Atlantic side, the mainland is generally rocky and open to the sweep of Atlantic storms; it is deeply indented and has numerous harbours providing safety for the large fishing fleets that support the extensive fishing industry of the Province (see Chapter XIV). The slopes facing the Bay of Fundy and the Gulf of St. Lawrence are sheltered from the Atlantic by low mountainous ridges not exceeding an altitude of 1,500 feet and running through the centre of the Province. In striking contrast to the Atlantic side, they present fertile plains and river valleys especially adapted by climate and situation to the growth of apples, pears and other fruits.

**New Brunswick.**—New Brunswick is nearly rectangular in shape with an area of 27,985 square miles and may be compared in size to Ireland (26,600 square miles). The Bay of Chaleur on the north, the Gulf of St. Lawrence and Northum-

berland Strait on the east, the Bay of Fundy on the south, and Passamaquoddy Bay on the southwest, provide the Province with a very extensive sea-coast. It adjoins the State of Maine on the west and the Province of Quebec on the north and northwest.

The conformation of New Brunswick is, in general, undulating, but to the east it attains its highest elevation of 2,690 feet in the vicinity of Grand Falls on the St. John River. In the northeastern half of the Province there are extensive areas of Crown lands carrying valuable stands of merchantable timber. Numerous rivers provide access to the extensive lumbering areas and to attractive hunting and fishing resources. The Province is watered to the west and south by the St. John River, which, in its course of 400 miles, runs through country famed for its distinctive beauty.

While the forest resources are of first importance economically, large areas of rich agricultural land are found in the numerous river valleys, especially that of the lower St. John, and in the broad plains near the coast. Natural gas and petroleum are obtained in limited quantities and coal mining on a moderate scale is carried on in the Minto Basin at the head of Grand Lake.

**Quebec.**—Quebec is the largest province of Canada and occupies the area of North America east of Hudson Bay, with the exception of Newfoundland and the other Atlantic Provinces. It has an area of 594,860 square miles, equal to the combined areas of France, Germany and Spain, but a large part of the surface is made up of Precambrian rocks of the Canadian Shield, which renders it unsuitable for agriculture. The Gulf of St. Lawrence and the River St. Lawrence penetrate the entire width of Quebec and divide the Eastern Townships and the Gaspé Peninsula to the south from the larger area of the Province to the north. North of the St. Lawrence the land takes the form of a ridge parallel to the river and rises from sea-level to the Height of Land (varying from 1,000 to 3,000 feet) from which it descends gently to sea-level at Hudson Bay and Hudson Strait.

With the exception of the treeless zone, extending north of latitude 58°, most of the Province supports a valuable tree growth varying from the mixed forests in the southwest to the coniferous forests in the east and north. In addition to extensive timber limits, which form the basis of a great pulp and paper industry (see Chapter XII), Quebec is the foremost of the provinces in the development of hydro-electric power (see Chapter XVI) and has available water-power resources, at ordinary minimum flow, almost equal to those of Ontario and Manitoba combined. Its asbestos deposits have long been known for their quality and extent. Extensive developments of gold and copper have taken place in the western part of the Province and the mineralized area is being extended year by year. Quebec is in second place in mineral production among the provinces of Canada (see Chapter XV). Its fisheries in the St. Lawrence River and Gulf are an important resource. The climate and soil of the upper St. Lawrence Valley and of the Eastern Townships are well suited to general farming operations, including dairying and the production of vegetables on a commercial basis.

**Ontario.**—Lying between Quebec on the east and Manitoba on the west, Ontario is usually regarded as an inland province but its southern boundary has a fresh-water shore line on the Great Lakes of 2,362 miles while its northern limits have a salt-water shore line of 680 miles on Hudson and James Bays. There is a tidal port at Moosonee at the southern end of James Bay. The most southerly point in the Province is Middle Island at 41° 41' N. latitude (this is also the most

63207—2½

southerly point in Canada) and the most northerly latitude of the Province is 56° 50'. It has an area of 412,582 square miles.

As in Quebec, the surface of Ontario follows the conformation characteristic of the Precambrian Shield except in the Ontario Peninsula where the surface is low and level. The highest point in Ontario is 2,120 feet, on the promontory at the northeastern corner of Lake Superior. Northwest from the Height of Land, the slope descends very gently to Hudson Bay where a large marginal strip (the Hudson Bay Lowlands) is less than 500 feet above sea-level.

Mining is a very important industry in the wide-spread Precambrian area; as in the adjoining Province of Quebec, Ontario is lacking in native coal but is rich in other minerals and contributes almost one-half the total mineral production of Canada. Gold, silver, nickel, copper, zinc, magnesium, dolomite, gypsum, salt and other minerals are mined commercially. Petroleum and natural gas are also produced on an important scale in the Ontario Peninsula (see Chapter XV).

The geographic position of Ontario on the Great Lakes waterways system permits coal to be transported economically from Pennsylvania and iron ore from Minnesota to provide the basis of a large iron and steel industry. There is a rich iron-ore development in the Steep Rock district west of Port Arthur and an abundance of natural resources has made Ontario the foremost industrial province of Canada (see Chapter XVII).

The lands along the St. Lawrence possess excellent soil and general farming is carried on extensively. In the Niagara Belt, fruit farming has been scientifically developed and is a highly specialized industry throughout the Ontario Peninsula.

Vast forest resources in proximity to hydro power (see Chapter XII) are the basis of large wood-using industries and the forests of the north are a rich fur preserve.

**Manitoba.**—Manitoba, covering 246,512 square miles, is roughly the size of France and is the most central of the provinces. Together with the Provinces of Saskatchewan and Alberta, it constitutes the famous Prairie Belt or Interior Plain section of Canada—world renowned for the quality of its wheat.

The Province has a considerable area of prairie land but is also a land of wide diversity combining 400 miles of sea-coast (on a rocky belt along its northeastern boundary, bordering Hudson Bay); great areas of northern mixed forests; large lakes and rivers covering an area of 26,789 square miles; a belt of treeless prairie extending to the southeastern corner of the Province; and patches of open prairie overlain by very fertile soil of great depth. The surface of the Province as a whole is comparatively level, the average elevation being between 500 and 1,000 feet; the greatest height of 2,727 feet is Duck Mountain northwest of Lake Dauphin.

About three-fifths of the Province, east and north of Lake Winnipeg, is underlain with Precambrian rock in which the presence of rich deposits of base metals has been confirmed, as in Ontario and Quebec (see Chapter XV).

The Province, although regarded as basically agricultural, possesses a wealth of water-power resources (Manitoba ranks after Quebec, British Columbia and Ontario on the basis of available power at ordinary minimum flow) that, together with mineral and forest riches, have brought about an expanding industrial development.

**Saskatchewan.**—Saskatchewan lies between Manitoba and Alberta extending, like each of the Prairie Provinces, from the International Boundary on the south to the 60th parallel of latitude which divides it from the Northwest Territories. It has an area of 251,700 square miles.

The northern half of the Province is abundantly watered by lakes and rivers and the topography is one of low relief. The Precambrian Shield, which covers most of Quebec, Ontario and Manitoba, penetrates over the northern third of Saskatchewan and has given evidence of potential richness of mineral wealth. This area is also rich in timber resources while the southerly two-thirds of the Province is generally fertile prairie with soil of great depth. In normal years there is sufficient moisture for rapid growth and the abundant sunshine during the long summer season in this northern latitude quickly ripens the crops.

**Alberta.**—This Province, covering 255,285 square miles, lies between Saskatchewan and the Rocky Mountains. The southern part of the Province is in the dry, treeless prairie belt, changing to the north into a zone of poplar interspersed with open prairie. This gives way to mixed forests covering the more northerly parts. The Precambrian rocks enter Alberta at its northeast corner, so that, excepting the fringe of mountainous country on its western border, practically the whole of the Province is overlain by arable soil of great depth. Alberta has two marked features: (1) the great valley of the Peace River, that has resulted in the extension of settlement farther north than in any other part of Canada; and (2) the wonderful grazing lands in the foothills district which, rising sharply on the west, commence the ascent that continues to the very peaks of the Rocky Mountains. The southern half of the Province, rising towards the west, lies at a general elevation of from 2,000 to 4,000 feet; but in the northern half, the slope descends until elevations of well under 1,000 feet are reached at Lake Athabaska in the northeast corner.

Alberta has the most extensive coal resources of any of the provinces and has become the leading producer of petroleum and natural gas. The new fields of Leduc and Redwater together with the older Turner Valley field produce the bulk of Canadian oil; other fields such as Lloydminster, which is partly in Saskatchewan, and Princess are also being developed. Lumbering is important in the more mountainous western parts and in the north, but ranching is still pursued in the less populous sections. In the southern prairies there are considerable areas where the quantity and distribution of the natural precipitation make permanent agriculture precarious and, in these areas, a number of large irrigation projects have been developed, taking their water supply from rivers rising in the mountains that form the western boundary of the Province (see Chapter XI). The climate of Alberta is a particularly pleasant one, cooler in summer than the more eastern parts of the country and tempered in winter by the chinook winds.

The coal and oil resources provide the basis of Alberta's industrial development and Edmonton is the railhead for the north country.

**British Columbia.**—British Columbia, the third largest and the most westerly province of Canada, includes many islands of the Pacific, notably Vancouver Island and the Queen Charlotte Islands, the area of the former being about 12,408 sq. miles. The total area of the Province is 366,255 sq. miles.

The predominant feature of the Province is the parallel ranges of mountains that cover all except the northeast corner and produce a conformation characterized by high mountain ranges interspaced with valleys many of which are extremely fertile, with climatic conditions well adapted to mixed agriculture or fruit growing. Generally the agricultural areas of these valleys are relatively small and broken but there are two large areas in the Peace River Block and the Stuart Lake District that are rich and have great agricultural possibilities. The shore line of the Pacific is deeply indented with many inlets ideal for harbourage and has wonderful scenic aspects.

The wealth of forest resources supports the lumbering and pulp and paper industries and places British Columbia first among the provinces in the production of lumber and timber (see Chapter XII). The Province excels in fishery products, chiefly on account of its catches of the famous Pacific salmon. The mineral resources are remarkable for their variety and wealth. Production of gold, copper, silver, lead and zinc has played an important role in the economic life of the Province since its early days, while valuable coal deposits on Vancouver Island and at Crowsnest and Fernie in the interior have been worked for many years. In water-power resources (at ordinary minimum flow) British Columbia ranks after Quebec (see Chapter XVI).

**Yukon and the Northwest Territories.**—North of the Western Provinces the Territories extend over an area of 1,511,979 square miles. This is largely an undeveloped domain, and for administrative purposes is divided into Yukon Territory and the Northwest Territories: the latter is subdivided into three Provisional Districts. This vast area is over twelve times the area of the British Isles and about one-half the area of the United States. Great rivers, like the Mackenzie and the Yukon, and large inland bodies of water, such as Great Slave and Great Bear Lakes are found there. Indications of mineral wealth are many; a number of rich gold-bearing deposits are under development and many prospects are being investigated in the Yellowknife area. There are important radium mines on the shores of Great Bear Lake.

The Northwest Highway System (Alaska Highway), completed in 1943, links Yukon, through Edmonton, Alta., and cities of the Prairie Provinces with the United States. Airports and other facilities have been provided over wide sections of the Mackenzie Valley and Yukon, and travel and transport by air will, undoubtedly, have a great influence on the development of the Territories. Details regarding the resources and administration of these areas are given in Chapter XXIX.

## PART II.—GEOLOGY\*

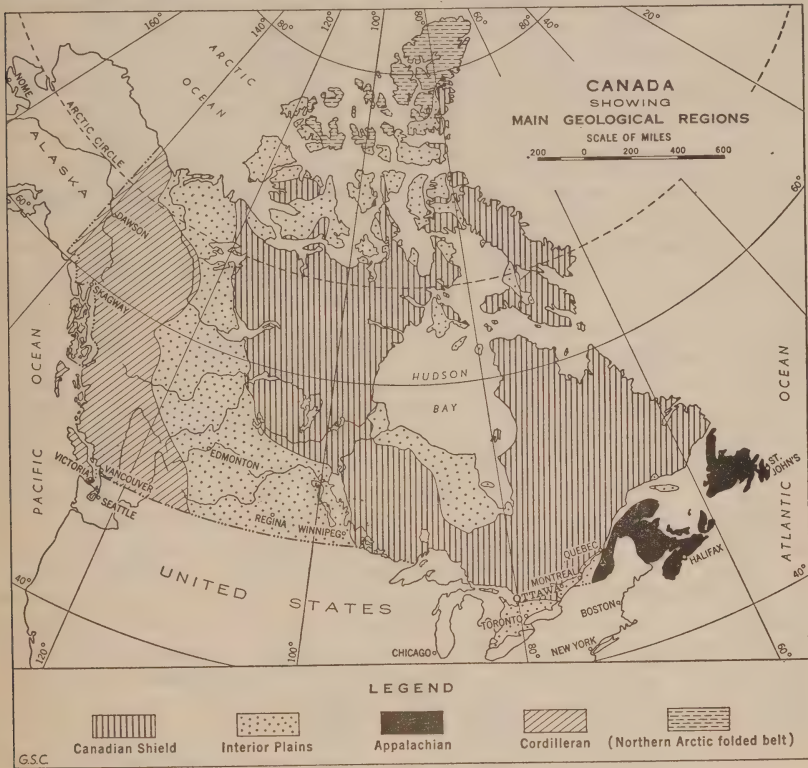

Geologically, Canada falls into the following major divisions: (1) the Canadian Shield; (2) the Appalachian Region; (3) the Interior Plains; and (4) the Corailleran Region. Nearly everywhere these are sharply demarcated from one another, and each has its own characteristic topography as well as geology. A fifth division, about which much less is known, includes a part of the Arctic Archipelago.

The Canadian Shield is the solid base around which the other Regions are framed. It occupies an area of approximately 1,800,000 square miles, forming an immense 'V' with an arm on each side of Hudson Bay. Physiographically, it is a heavily glaciated region for the most part of low relief, hummocky topography, and highly disorganized drainage. Its surface elevation varies from sea-level to more than 5,000 feet in northern Labrador. It is the great lake region of the world, probably containing more lakes than all the rest of the world together. Its rocks include sedimentary, volcanic and intrusive varieties of widely different ages but all Precambrian. In late Precambrian time the Region was peneplaned, or reduced to low relief, and since then it has experienced relatively little deformation. Vertical movements have, however, repeatedly taken place, some undoubtedly accompanied by faulting, and Palaeozoic and Mesozoic seas advanced over parts of it and later retreated from it. In Tertiary time erosion stripped off much of the covering

\* Prepared under the direction of H. L. Keenleyside, Deputy Minister, Department of Resources and Development, by F. J. Alcock, Ph.D., F.R.S.C., Chief Curator, National Museum of Canada.

sediments that had been deposited in these seas. Recurrent igneous activity in Precambrian time was accompanied by ore deposition and the Shield is a great storehouse of mineral wealth.

The Interior Plains Region borders the Shield on the west and south. It is underlain by Palæozoic, Mesozoic, and locally Tertiary strata, for the most part flat-lying or only slightly disturbed. The boundary with the Shield is an erosional

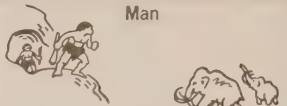

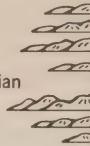

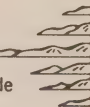

one, marked by the edges of the overlapping sediments. Small areas within the Shield and larger ones, such as the Hudson Bay Lowland bordering the west coast of James and Hudson Bays, and parts of the Arctic Islands, are outliers of this Region. Southern Ontario and most of the lowland belt along the St. Lawrence River form another area which, though geographically separated in Canada from the western plains, is united with them through the United States to the south. Between the Interior Plains and the remaining two major geological regions—the Appalachian to the east and the Cordilleran to the west—the essential difference is that, whereas the strata of the Plains lie horizontally, those of the other two are for the most part highly deformed as a result of mountain-building movements.

The Appalachian Region includes the Provinces of Nova Scotia, New Brunswick, Prince Edward Island, Newfoundland, and that part of the Province of Quebec lying south and east of the St. Lawrence River. It is a continuation of the Appalachian Mountain System of the United States and, like it, is underlain largely by

# GEOLOGICAL TIME CHART

G S C

rocks of Palæozoic age. It is a Region that has experienced intense folding and thrust faulting, but the final major orogeny took place not at the close of the Palæozoic, as it did farther south in the United States, but in Middle Devonian time.

The boundary between the Appalachian Region and the Interior Plains Region to the northwest is a major dislocation known as Logan's Line, a thrust fault first recognized by Sir William Logan, founder of the Geological Survey of Canada. It runs from Lake Champlain to Quebec city and thence down the St. Lawrence River between Gaspé Peninsula and Anticosti Island. To the northwest of this break, the strata of the St. Lawrence Lowlands lie flat for the most part, and what faults occur are mostly of the normal type. To the southeast the strata of the Appalachian Region are highly inclined, locally overturned, and the pre-Carboniferous faults are of the thrust variety.

Physiographically, the Appalachian Region is made up of uplands and lowlands. The former represent mountain structures that were peneplaned probably in the Cretaceous period and later uplifted; the latter are broad areas carved out of these uplands in places where the rocks are softer and hence more easily eroded. The highest elevation, 4,200 feet, is that of Mount Jacques Cartier on Tabletop Mountain in the Shickshock Range of central Gaspé.

The Cordilleran Region comprises the mountainous belt of British Columbia, Yukon and adjacent territory. It is made up of a series of ranges and plateaux separated by great linear valleys or trenches trending mainly northwesterly. Within this Region the Rocky Mountains, Foothills, and Mackenzie Mountains in the east are separated from the Coast Mountains of the Pacific border by a wide zone of the Interior Plateaux and Mountains. The rocks of the Region range in age from Late Precambrian to Recent. Proterozoic and later eras are represented over wide areas and locally volcanic eruptions have continued into Glacial and Recent times. The western part was affected by mountain-building movements and batholithic intrusion at intervals throughout Mesozoic time, possibly reaching a maximum during late Jurassic and early Cretaceous epochs. At the close of the Cretaceous period and extending into early Tertiary time, another great revolution, the Laramide, resulted in the folded structures of the Rocky and Mackenzie Mountains. Local deformation, consisting of vertical movements, faulting and minor folding, also took place in later Tertiary time. To the south in the United States this disturbance, referred to as the Cascadian, is known to have continued into Pleistocene and even Recent time. During the Pleistocene most of the Cordilleran Region of Canada was glaciated.

The Arctic Islands of Canada, together with Boothia and Melville Peninsulas, form a geographic unit whose land area exceeds half a million square miles. Geologically, many of the individual areas may be regarded as outliers either of the Canadian Shield or of the Interior Plains, those of the former commonly attaining much greater elevations than those of the latter. On Baffin Island, for example, a range of Precambrian rocks has a height of at least 5,000 feet above sea-level, with occasional peaks rising much higher. The rocks of the Plains outliers are either flat-lying or only slightly disturbed and consist of Palæozoic and younger beds. Triassic and Jurassic strata are known in some of the northern islands, and small basins of Tertiary sediments are found in numerous localities.

All the areas of Palæozoic and Mesozoic rocks in the Arctic Archipelago, however, cannot be regarded as outliers of the Interior Plains. On Ellesmere Island to the northwest of Greenland are folded strata forming mountains with elevations

up to 12,000 feet. Folded rocks are also known to occur on Axel-Heiberg Island to the west with elevations up to 7,000 or 8,000 feet, and air photographs indicate similarly deformed measures on Bathurst and Melville Islands. This gives a length of some 800 miles in a southwest direction to the disturbed zone. The age of some of the strata involved is known to be Ordovician and that of others Silurian and it has been suggested that the folding may have taken place near the close of the latter period. At other places, however, the deformed beds include some as young as Jurassic. Although the amount of information at present available regarding the extent, age, and structural relations of these rocks, and also regarding the time or times at which the orogenic movements that deformed them took place is comparatively meagre, it is apparently sufficient to necessitate the differentiation of the disturbed belt as a fifth major geological region.

### Salient Features of each Geological Region

**Canadian Shield.**—Precambrian time is divided into two Eras. At many places throughout the Shield an older complex of volcanic and sedimentary rocks, commonly highly metamorphosed and injected and intruded by granites and other rocks, is separated by a great structural unconformity from an overlying younger group or groups usually less highly altered but also intruded, locally at least, by deep-seated irruptives. Geological time prior to this erosional interval is referred to as Early Precambrian or Archæan, and the remaining Precambrian time is called Late Precambrian or Proterozoic. It is not thought that the time interval represented by a major unconformity of this type in one area was necessarily precisely contemporaneous with the interval represented by a similar unconformity in a widely separated area. To define, therefore, the exact boundary between the two Eras, the unconformity at the base of the Huronian strata in northern Ontario is selected. Similar breaks in other regions can be correlated only tentatively with this. Perhaps some day, when more numerous and more reliable determinations than at present exist are available on the age of intrusive rocks, Precambrian correlation will be on as secure a foundation as that of later time where life as revealed by fossils is the basis for subdividing geological time.

Over much of the Shield the common rocks are granites and gneisses: many of the latter are hybrid types—altered and granitized sedimentary and volcanic rocks injected by much granitic material—that afford but little information regarding Precambrian history. Elsewhere, however, are scattered areas, many of them small but others of considerable extent, in which successions of other more recognizable volcanic and sedimentary strata occur. These have provided significant geological information and are also important in that they offer favourable possibilities for prospecting.

The Archæan Era is divided into Keewatin and Timiskaming time. The term "Keewatin" was first applied to certain ancient lavas in northwestern Ontario, but was soon extended to early Precambrian volcanic assemblages elsewhere. Work in many parts of the Shield has shown that interbedded with such volcanic rocks are large volumes of sediments. These include bedded ash and agglomerate types, banded iron formation, and clastic varieties metamorphosed to mica schists and quartzites. The Keewatin volcanic rocks are largely basalts and andesites, commonly showing ellipsoidal and amygdaloidal structures, but also include more acidic lavas and related pyroclastic rocks.

Timiskaming time is represented in a number of areas by a group of sedimentary rocks, commonly conglomeratic. They overlie the Keewatin rocks commonly with a slight angular unconformity. With them, locally, are associated volcanic

rocks, so that the assemblage in places bears much resemblance to Keewatin groups. These rocks have been described under many different local names, the Doré Series of Michipicoten, the Windigokan Series east of Lake Nipigon, the Seine Series of Rainy Lake and Steep Rock Lake, the Missi Series of northern Manitoba, etc. These clastic sediments contain boulders of granite believed to have been derived from masses intruded into the Keewatin rocks during an orogeny referred to as the Laurentian.

In the Grenville region of southern Ontario and extending across Quebec into southern Labrador, the oldest rocks are mica schists and gneisses, quartzites and crystalline limestone of what is known as the Grenville Series. In Ontario, another series, known as the Hastings, overlies the Grenville rocks with an erosional unconformity, but with little apparent structural discordance. Both the Grenville and Hastings rocks are intruded by a group of gabbros, anorthosites, pyroxene diorites and pyroxene syenites and, still later, by dykes, sills, stocks and batholiths of granite, syenite and their gneissic equivalents. The age relation of the Grenville rocks to the Keewatin volcanic rocks of the adjacent Timiskaming region is still unsettled and recent investigations seem to imply an almost, if not quite, continuous fault zone along the contact.

Archæan time was closed by a great mountain-building revolution, the Algoman, which was accompanied by the intrusion of granites on a vast scale. Peneplanation followed and on the eroded surface Proterozoic rocks were laid down. Proterozoic time, like Archæan, falls into two divisions, the Huronian and the Keweenawan, and the Huronian, in turn, comprises three recognizable subdivisions, each of which, in length of time involved, is probably of at least period rank.

The Lower Huronian rocks of Canada, termed the Bruce Series, are confined to a narrow zone along the north side of Lake Huron and stretching to about 23 miles east of Sudbury. They consist of the Copper Cliff rhyolite, and impure quartzite, greywacke, conglomerate and limestone, with a total thickness of nearly 15,000 feet. The sediments all show crossbedding, ripple-marks and other evidence of shallow water deposition.

The Cobalt Series accumulated in Middle Huronian time. It rests with little or no structural discordance on the Bruce Series, and overlaps the basement rocks for 100 miles to the north. The Series comprises two formations, the Gowganda and the Lorrain, the former having a maximum thickness of about 3,500 feet and the latter 7,000 feet or more. The Gowganda has at its base a thick boulder conglomerate—a tillite—a rock produced under glacial conditions, and this is overlain by greywacke, the upper part of which is varved suggesting that deposition took place in glacial lakes. The Lorrain consists dominantly of quartzites. Rocks resembling these Middle Huronian sediments occur in several widely scattered areas over the Shield. In the Lake Huron area, Middle Huronian time closed with movements that folded the Bruce and Cobalt Series. These movements were accompanied by the intrusion of great dykes and sills of gabbro, commonly called the Nipissing diabase.

Upper Huronian time is represented, tentatively, by several groups of rocks whose relative age is uncertain—the Animikee of the northwest shore of Lake Superior, the Nastapoka of the Belcher Islands and Richmond Gulf, the Mistassini Series of Lake Mistassini region, late Precambrian rocks of central Ungava, and other groups in the northwestern part of the Shield. These consist of conglomerate,

slate, greywacke, cherty iron formation, carbonate rocks, sandstone, shale and locally volcanic rocks. Towards the close of the period, crustal movements took place accompanied locally by the intrusion of granite.

Rocks believed to have been deposited in late Proterozoic or Keweenawan time are found in widely separated areas of the Shield. The Sibley Series and a younger Osler Series, both occurring east of Port Arthur, part at least of the Whitewater beds of the Sudbury Basin, the Athabaska Series of the Lake Athabaska and adjacent regions, and the Coppermine River Series of the Arctic Coast are some of the more important of these groups. They consist dominantly of clastic beds, but include some interbedded lavas. Late Keweenawan time was marked by uplift, the intrusion of the Killarney granite and other igneous rocks and then by long-continued erosion, so that the succeeding oldest Palæozoic rocks rest on a peneplaned surface of very low relief.

The Precambrian rocks of the Canadian Shield are the source of a great abundance and variety of mineral deposits. Iron formation is present in the Keewatin and Animikie rocks, the iron ores of the Steep Rock, Helen, Magpie, and Josephine mines in western Ontario being in formations of the former and the extensive deposits along the Quebec-Labrador Boundary in rocks of the latter age; gold, copper, lead, zinc, etc., occur chiefly in the Archæan formations; silver and cobalt are associated with the Nipissing diabase; nickel and copper with a Keweenawan irruptive of the Sudbury area; native copper with the Keweenawan Coppermine River lavas; pitchblende, a uranium-bearing mineral, in rocks as young as the Athabaska Series in northwestern Canada; ilmenite in important quantities is present at Allard Lake and other places in the Province of Quebec in anorthosite intrusive into Archæan rocks and titaniferous magnetites are known at many places.

The Shield was heavily glaciated. Polished, grooved and striated surfaces are seen nearly everywhere, and *roches moutonnées*, with well-marked lee and stoss slopes, clearly indicate the direction of glacial advance. Eskers, kames, beaches, etc., can be recognized in many places on aerial photographs of the country. Erosion and deposition by the ice-sheets were responsible for the disorganization of the drainage and the production of the myriads of lakes.

**Appalachian Region.**—In the Appalachian Region of Canada are rocks ranging in age from Early Precambrian to Triassic. At Saint John, New Brunswick, fossiliferous Lower Cambrian rocks are underlain by a thick volcanic series, the Coldbrook, regarded as Late Precambrian. This is, in turn, underlain unconformably by the Green Head group, composed of crystalline limestone, quartzite, paragneiss, etc., in many respects resembling the Grenville of the Shield. Although considered to be Archæan, it, nevertheless, carries cryptozoan-like forms which have been described under the name *Archæozoon acadense*. Rocks somewhat similar to parts of the Green Head occur in most of the upland areas of Cape Breton Island and in Newfoundland.

Besides the Coldbrook group of New Brunswick, other groups believed to be also of Late Precambrian age include the Meguma or Gold-bearing Series of Nova Scotia, rather similar assemblages in the Chaleur Bay region and in southwestern Quebec, and sedimentary and volcanic rocks in the eastern part of Newfoundland.

The Palæozoic rocks, which cover most of the Appalachian Region, range in age from Lower Cambrian to Pennsylvanian. Throughout most of the Region and repeatedly during the Era, deposition appears to have taken place in local basins, rocks of the same age varying widely in both lithology and fossil content. In

southern New Brunswick the Saint John group consists of an apparently conformable series, comprising Lower, Middle and Upper Cambrian and also Lower Ordovician beds, and areas underlain by Cambrian strata occur also in Newfoundland, in Cape Breton Island, and in southern Quebec. Ordovician rocks are widespread and all three divisions, Lower, Middle and Upper, are represented. In Late Ordovician time a great deformation, the Taconic, affected much at least of the Region, and was accompanied by the intrusion of masses of peridotite. The thickest succession of Middle Silurian rocks in North America, 8,427 feet of sedimentary and 4,626 feet of volcanic rocks, all conformable, is exposed at Black Cape in the Chaleur Bay region. In the St. George region of New Brunswick, sedimentary deposition during the Silurian was small, but volcanic activity was great. Lower Devonian rocks succeed the Silurian beds in many localities following an interval of erosion. One of the best sections is at the east end of Gaspé Peninsula, where Logan defined the 'Gaspé limestones'. This Series is overlain by a thick assemblage of clastic sediments of Middle Devonian age, known as the 'Gaspé sandstone', and on the north side of Chaleur Bay, near Maguasha, is a succession of Upper Devonian beds noted for the fossil fish which are present locally. Lower Devonian and older strata are intruded by masses of granite and locally mineralized with quartz-carbonate veins, carrying zinc, lead, copper and other minerals. The Middle Devonian rocks are folded and the Upper Devonian only slightly disturbed. Evidently the main orogeny took place in late Lower Devonian or early Middle Devonian time, with renewed movements late in the Middle Devonian and again in diminished amount at the close of the Upper Devonian epoch.

These movements constitute the Shickshockian disturbance, and the results can be seen at a number of places in the Chaleur Bay region where flat-lying beds of the Carboniferous Bonaventure formation overlie tilted and eroded beds of older Palæozoic formations. Granites and related deep-seated intrusions of Devonian age are widespread throughout the Appalachian Region, and Upper Devonian strata carry boulders derived from these intrusive rocks.

The Carboniferous history of the Region was complex. Mississippian time is represented by strata of Horton and Windsor ages. Deposition in Horton time was in local basins, but during succeeding Windsor time a sea submerged much of the Region and locally, as in the Magdalen Islands, intense volcanism occurred. Pennsylvanian time was marked by local orogeny and volcanism, faulting and broad warping movements, and by the deposition of coal with each of the successive Riversdale, Cumberland and Pictou sedimentary groups. The great Appalachian revolution which took place at the close of the Palæozoic Era in the United States to the south had only comparatively minor effects in Canada.

Triassic sandstones, with interbedded volcanic rocks similar to the Palisade rocks along the Hudson River, occur in the Bay of Fundy area. They are broken by faults. On Grand Manan Island a major break brings Early Precambrian sediments alongside Triassic flows, the oldest rocks of the Region in knife-edge contact with the youngest. These fault movements probably took place in Triassic and Jurassic time. During the Cretaceous period the Region was peneplaned. The Tertiary was a time of uplift and erosion, with the development of broad lowlands and local peneplains. The Pleistocene saw the development of local centres of glaciation, and the entire Region was covered by the Labrador Ice Sheet.

The mineral resources of the Appalachian Region include asbestos, associated with serpentinized peridotite in southeastern Quebec; iron, with the Ordovician sediments of Bell Island, Conception Bay, Newfoundland; coal in the Pennsylvanian

rocks of Nova Scotia, New Brunswick, and Newfoundland; gypsum and barite in the Windsor series; and gold, copper, zinc, lead, fluorite, and other deposits most of which at least are genetically related to the Devonian granitic intrusions. The Buchans mine near Red Indian Lake, Newfoundland, is an important producer of zinc, lead and copper.

**The Interior Plains.**—*Western Canada.*—The Interior Plains of the Prairie Provinces slope gently eastward from an elevation of about 4,000 feet in western Alberta to about 500 feet in southern Manitoba. They show a flat surface interrupted by deep-incised valleys and by many flat-topped hills or mesas. The area of the Plains is divided into three steppes by two eastward facing escarpments, the Manitoba escarpment forming the western border of the Manitoba Lowland, the lowest and most easterly of the three steppes, and the Missouri Couteau marking the eastern boundary of the Wood Mountain Plateau, the third and highest steppe.

The Plains are underlain by sedimentary rocks of Palæozoic, Mesozoic and Tertiary age. Where the Palæozoic rocks outcrop at the western border of the Canadian Shield the oldest sediments are of Ordovician age. Farther west, in Saskatchewan, drilling has shown Cambrian beds to be present. For example, in the bordering part of the Cordilleran Region, the eastern mountains of southern Alberta, and the Mackenzie and Franklin Mountains in Northwest Territories, are thick successions of Cambrian shales, dolomites and limestones.

The Ordovician strata resting on the Precambrian in Manitoba thin westward beneath the Plains and, so far as is known, do not underlie the northern plains of Alberta. In the eastern Rocky Mountains, however, both early and late Ordovician beds are present. Middle Silurian beds less than 450 feet thick are known in Manitoba. Drilling has shown the presence of similar strata in Saskatchewan, and limestones and dolomites of supposedly Silurian age underlie most if not all of the Mackenzie Lowlands. Devonian strata are present under all the Interior Plains; they consist of limestone and dolomite of Middle and Upper Devonian age. Mississippian beds overlie the Devonian in southern Saskatchewan and Alberta and a fringe of unknown width skirts the east edge of the Foothills.

Mesozoic rocks stretch westward from the Manitoba escarpment. They range in age from Triassic to Cretaceous. Marine siltstones, calcareous shales and arenaceous limestone of Triassic age are known to underlie at depth the northwestern part of the central Plains. Jurassic beds overlie the Triassic, where present, or rest on Palæozoic formations in southern Manitoba, southern Saskatchewan, and in southern and western Alberta along the western edge of the Interior Plains. In the west these strata are marine, but towards the east, in Saskatchewan and Manitoba, they grade into a mixture of marine and non-marine beds.

The Cretaceous period saw widespread deposition on the site of the Interior Plains and Rocky Mountains. Lower Cretaceous history included deposition of sandstone, shale and coal beds in a narrow trough along the western border, followed by the spread of such deposits far to the east, and closed with marine invasions from the north. Upper Cretaceous history included a marine invasion of vast extent followed by recurrent advances of delta plains from the west, and closed with widespread non-marine deposition and the complete expulsion of the sea.

Non-marine deposition continued throughout Paleocene time. In the early Eocene, uplift and erosion was followed by deposition of late Eocene, Oligocene and Miocene gravels derived from the newly uplifted Rocky Mountains and to-day preserved mostly on the Cypress Hills and Wood Mountain, residual uplands on an

old Tertiary watershed. The Plains, except for the top of the Cypress Hills and a small area near Rockglen in southern Saskatchewan, were covered by Pleistocene ice-sheets.

The mineral deposits of the western plains are for the most part non-metallic varieties. Coal occurs in Upper Cretaceous beds in Alberta and in Paleocene strata in Saskatchewan. Natural gas is produced in large quantities principally from various horizons of the Cretaceous in Alberta and in smaller amounts from beds of similar age in Saskatchewan. Petroleum is obtained from Devonian, Mississippian and Cretaceous rocks. In the new important fields of central Alberta, the major production is from strata of Upper Devonian age and at Norman Wells in the Mackenzie Valley the oil is also in Devonian beds. Bituminous sands occur along the Athabaska River in the basal member of the Lower Cretaceous. Gypsum and salt are obtained from Palæozoic strata in Manitoba and occur also in Alberta. Deposits of zinc and lead are known in Devonian limestone at localities south of Great Slave Lake; clay, sodium sulphate, and building stone are other mineral products.

*St. Lawrence Lowlands.*—The St. Lawrence Lowlands stretching from Lake Huron northeasterly to Anticosti Island falls into three subdivisions. The first and most westerly includes Manitoulin Island and the part of Ontario facing on Lakes Erie and Ontario. It is made up of two parts separated by a prominent topographic feature, the Niagara Escarpment, an abrupt eastward-facing rise, 250 to 300 feet high, extending northwesterly from Niagara River to Bruce Peninsula. The Escarpment is due to differential erosion, the softer Ordovician strata having been more easily removed than the harder overlying Silurian dolomite. The eastern border of this subdivision is the Frontenac Axis, a southward projection of the Canadian Shield that crosses the St. Lawrence between Kingston and Brockville. The second subdivision extends from the east side of the Frontenac Axis to Quebec city and has for its eastern border the Logan Fault. The third subdivision, separated from the second by about 360 miles of the St. Lawrence River, comprises Anticosti Island and the Mingan Islands.

The strata of the entire belt are of Palæozoic age, for the most part lying flat or with low dips. They are almost wholly of marine origin and were deposited in seas that swept over a large part of the continent. Differential vertical movements caused these seas to advance and retreat so that the sediments deposited in them vary considerably. There are also local gaps in the sedimentary sequence caused by these movements, which were apparently so gentle that there are no angular unconformities.

In the western subdivision the rocks range in age from possibly late Cambrian to late Devonian. East of the Niagara Escarpment the beds are of Ordovician age. Along the Escarpment these rocks are succeeded by Silurian measures. The lowest of these are the Medina sandstones and shales, which are succeeded by the Clinton dolomite. This is followed by the Rochester shale and Lockport dolomite and these in turn by the Guelph dolomite, the Salina formation of dolomite, shale gypsum and salt and the Bertie-Akron dolomite. The total thickness of the Silurian measures is over 2,500 feet. The overlying Devonian beds consisting of the Oriskany sandstone, the Sylvania and Detroit River dolomite, limestone and chert, the Onondaga and Delaware limestone, the Hamilton grey shale, and the Kettle Point black shale have a thickness of more than 1,500 feet.

In the second subdivision the sedimentary succession begins with sandstone of Upper Cambrian or Lower Ordovician age and includes Lower, Middle, and Upper Ordovician strata, with a thickness of about 6,000 feet. The rocks are locally broken by faults.

In southern Quebec eight masses of alkalic intrusive rocks form the Monteregian Hills, the most westerly of which is Mount Royal at Montreal. Five of these lie in this second subdivision of the St. Lawrence Lowlands; the other three are east of the Logan Fault in the Appalachian Region. These intrusions are post-Lower Devonian in age and may be as young as late Tertiary.

The rocks on Anticosti Island in the third subdivision are of Upper Ordovician and Silurian age, all apparently conformable. Those on the Mingan Islands near the north shore of the St. Lawrence were deposited in the Beekmantown and Chazy sub-epochs of the Ordovician period.

The entire region of St. Lawrence Lowlands was overrun by Pleistocene ice-sheets, and much of the bedrock is covered by debris left by these glaciers. At Toronto, stratified deposits carrying plant and animal remains lie between deposits of glacial material. These layers show that the region was covered at least three times by ice-sheets from the central part of northern Quebec, and that between these advances the region had a climate considerably milder than it has at present. In late Pleistocene time the region was depressed and an arm of the sea extended up the St. Lawrence Valley as far as Brockville and up the Ottawa River Valley beyond the city of Ottawa. In this sea, to which the name Champlain is given, layers of clay were deposited and along its shores deposits of sand accumulated.

The chief mineral occurrences of the St. Lawrence Lowlands include petroleum and natural gas which are produced in southwestern Ontario mainly from Devonian beds but also in minor quantities from those of the Silurian and Ordovician; salt from the Silurian Salina formation in the counties bordering Lakes Huron and St. Clair; and gypsum from different horizons of the Salina in the Grand River Valley. Other materials available at many places are limestone and dolomite used in chemical and metallurgical industries, rock for construction purposes, and clay for the manufacture of brick, tile and cement.

*The Hudson Bay Lowland.*—The Hudson Bay Lowland bordering the west side of Hudson Bay has a length in a northwest direction of 800 miles, a width of 100 to 200 miles, and an area of 120,000 square miles. It rises from sea-level with a scarcely perceptible gradient to a height of about 400 feet. It is underlain by flat-lying rocks most of which are of Palæozoic age ranging from Ordovician to Devonian. An area of Mesozoic beds, Lower Cretaceous or Upper Jurassic, carrying lignite occurs in the Moose River Basin.

Smaller Palæozoic outliers on Lake St. John, Lake Nipissing, and Lake Timiskaming are mere remnants that have survived erosion in Mesozoic and Tertiary times.

**The Cordilleran Region.**—The Cordilleran Region comprises an Eastern System of mountain areas, and a Western Belt consisting of an interior system of plateaux and mountains flanked on the west by the Coast Mountains. The rocks of the Eastern System consist almost entirely of sedimentary formations of Proterozoic, Palæozoic and Mesozoic age, that succeed each other without pronounced angular discordance. Evidently basins of deposition persisted here throughout most of these eras. Intrusive rocks are known only in limited areas in the south, and sills and volcanic flows are locally of some importance as horizon markers.

Proterozoic rocks have their greatest thickness of 13,720 feet, and consist dominantly of siliceous dolomites and argillites with lesser amounts of quartzites, and one important sheet of basaltic lava. Lower, Middle and Upper Cambrian, and early Ordovician rocks occur in the Rocky Mountains and Upper Ordovician (Richmond) limestones in the Mackenzie Mountains. Silurian sediments are widespread, but the early Devonian was apparently a time of withdrawal of the sea from the Region as no strata of that age have been recognized. Middle and Upper Devonian limestones and shales are fairly widespread in both the Rocky Mountains and Mackenzie River region. Carboniferous beds overlie Devonian strata conformably in the Rockies, and Permian strata have been recognized on the Liard and Peace Rivers.

Triassic marine beds occur along the eastern flank of the Rocky Mountains, and in the eastern ranges are succeeded by Jurassic marine strata. At the close of the Cretaceous and extending into Paleocene time the Rocky Mountain area was subjected to orogenic forces that produced folding and over-thrusting from west to east, the Laramide revolution. Peneplains were developed in both the Rocky and Mackenzie Mountain areas during Tertiary time, and the present altitude of the Region is due to late Tertiary uplift. In Pleistocene time much of the area of the Eastern System was glaciated, but parts apparently remained free of ice.

The geology of the Western Cordilleran Belt is complex. The oldest rocks are of Precambrian age. The Shuswap rocks consisting of schists, crystalline limestones, gneisses and granitized varieties were at one time regarded as all of Archæan age. It is now known that these rocks are highly metamorphosed formations of mainly Late Precambrian and early Palæozoic ages. The Yukon group of the Yukon Plateau, consisting of schists, gneisses, crystalline limestone and greenstone, the Wolverine complex of central British Columbia, and the Cariboo Series of the Cariboo district, are also at least partly of Late Precambrian age, but Lower Cambrian fossils have been found near the top of the latter two. In southeastern British Columbia the Purcell Series consisting of 45,000 feet of quartzites and argillites is of early Proterozoic age, and is overlain unconformably by late Proterozoic sediments of the Windermere Series, 22,000 feet thick, consisting of conglomerate, slate, limestone, greenstone, schist and paragneiss. The Purcell and the Windermere strata are intruded by basic sills and dykes.

The Palæozoic record is fragmentary. Cambrian, Ordovician, Silurian and Devonian beds are all known locally. In Carboniferous and Permian times great thicknesses of sedimentary and volcanic rocks accumulated under marine conditions over much of the belt; in central British Columbia the Cache Creek group probably reaches a thickness of more than 25,000 feet.

Mesozoic strata range in age from Upper Triassic to Upper Cretaceous. The Triassic and Jurassic periods were marked by intense volcanism, but the contact between the two systems is only locally discordant. Jurassic rocks are widely distributed: the Laberge Series of Yukon has a thickness of 10,000 feet, and the Jurassic members of the Hazelton and Takla groups of central British Columbia are each probably just as thick. Lower Cretaceous strata are also widespread.

The Mesozoic era was a time of orogeny and of great, deep-seated igneous activity; the largest intrusive mass, that of the complex Coast intrusions, is 1,100 miles long and averages more than 50 miles wide. It comprises many phases, ranging in age from Triassic to Tertiary but chiefly late Jurassic to early Cretaceous, and varies in composition from granite to gabbro, the commonest types being

granodiorite and quartz diorite. The Cassiar-Omineca batholith within the central plateau and mountain area, is of similar composition. It has a length northwesterly of more than 500 miles, and a width up to about 25 miles.

The effects of the Laramide orogeny are less apparent in the Western Cordilleran Belt than farther east. During succeeding Tertiary time sedimentation took place in local fresh-water basins and accumulations of marine sediments formed in places near the present shoreline. Volcanism was active from Eocene to Recent times, reaching a climax in the Miocene or Pliocene. In general the Tertiary beds rest with angular discordance on the older rocks; early Tertiary strata lie in open folds, whereas later Tertiary beds are for the most part horizontal.

The Western Cordilleran Belt was largely covered by ice in Pleistocene time the most significant exception being the weathered Tertiary surface of part of Yukon that was not so covered. Near Vancouver, Pleistocene deposits reach a thickness of 1,100 feet and show tills of at least two different ages separated by stratified sands and clays.

The Cordilleran Region is a producer of gold, both lode and placer, copper, silver, lead and zinc and contains also deposits of mercury, tungsten and iron. Aside from a small area near Field in the Rocky Mountains, all the known metal-liferous occurrences are in the Western Cordilleran Belt and most of them at least are believed to be related to the late Mesozoic and early Tertiary granitic intrusions. The Region also produces coal, the deposits of which are widespread. Petroleum and natural gas are produced from fields in the eastern division, chiefly in the foothills region of Alberta. Fluorite, gypsum, magnesite, hydromagnesite, phosphate, saline deposits, building stone, and limestone for the production of lime and cement, form other valuable mineral occurrences.

### PART III.—GEOPHYSICS

Material on Gravity, Seismology and Terrestrial Magnetism will be found at pp. 18-27 of the 1948-49 edition of the Year Book.

### PART IV.—FAUNA AND FLORA

See list at the front of this edition for special material, under this heading, published in previous editions of the Year Book.

### PART V.—LANDS, PARKS AND WILDLIFE CONSERVATION

Canada is a comparatively new country with resources that are for the most part in the early stages of development. The fur, fishery and forest resources have, it is true, been the basis of trade for two to three hundred years, but exploitation on the present commercial scale is of relatively recent growth. Detailed information regarding individual natural resources will be found in later chapters, together with data concerning the efforts directed to conservation of those resources that admit of such methods. The following treatment of resources is concerned only with those summary phases of the subject that can be regarded as falling under the definition of physiography used in its wider interpretation.

## Section 1.—Lands Resources

The figures of Table 1 show how the land area is classified as between present and potential agricultural lands, present and potential forested lands, and lands that are unproductive as regards surface resources. Between the totals of present and potential agricultural lands and the totals of forested lands there is, of course, duplication to the extent of the agricultural lands under forest. The figures regarding agricultural lands are based on estimates from the Census of 1941 for all but the Prairie Provinces and Newfoundland; 1946 Census figures are used for Manitoba, Saskatchewan and Alberta and figures for the Island of Newfoundland are those of the 1945 Newfoundland Census. The Forestry Branch of the Department of Resources and Development supplies figures on forested lands and the Surveyor General those on the total land areas of Canada and the Provinces.

## 1.—Land Area, classified as Agricultural, Forested or Unproductive

NOTE.—Land area is shown classified by tenure in Chapter XXIX.

**Section 2.—National and Provincial Parks**

The Federal Government<sup>a</sup> and most of the Provincial Governments have set aside extensive areas of scenic beauty for the use of the people in perpetuity. The total areas of these parks, by provinces and territories, are given in Table 2.

## 2.—Areas of National and Provincial Parks, by Provinces and Territories

Province or Territory	National sq. miles	Provincial sq. miles	Total sq. miles
Newfoundland.....	—	42·00	42·00
Prince Edward Island.....	7·00	—	7·00

<b>Canada.....</b>	<b>29,147·38</b>	<b>31,823·40</b>	<b>60,970·78</b>

<sup>1</sup> Not including area of Gattineau Park, 25 square miles in extent (see p. 37).  
 Nipawin and Lac La Ronge unsurveyed lands, 1,392 square miles in extent.

<sup>2</sup> Includes

**National Parks.\***—Since the first National Park was established around the mineral hot springs at Banff, Alta., in 1885, the National Parks have grown in number to 26 and in area to more than 29,000 square miles. Fundy National Park in New Brunswick, formally opened in 1950, is the latest addition.

These Parks are maintained by the Federal Government for the preservation of regions of outstanding beauty and interest, for the protection of the flora, fauna and natural phenomena found there, and also for the preservation of places of great historical significance in the building of this nation. They are supervised by the National Parks and Historic Sites Service of the Development Services Branch, Department of Resources and Development, and are developed and maintained in such a manner that they will not be despoiled or exhausted by use but will continue to provide inspiration, education and healthful recreation for present and future generations.

The National Parks are Canada's greatest single tourist attraction. In 1949 more than 1,800,000 persons entered their gates for varying periods and for diverse purposes. Facilities for comfort and recreation are provided by the construction of swimming pools with dressing-room buildings; equipped camp-grounds, some with trailer-park facilities; golf courses with superb scenic settings; tennis courts, bowling greens; children's playgrounds; athletic fields; horseshoe pitches; out-door checker-boards; and, in some of the parks, amphitheatres where plays, concerts and picture shows are held in the open. For winter sports there are downhill and slalom ski courses, ski jumps, ski tows, a chairlift, ski lodges and chalets. Accommodation in the National Parks is provided mainly by private enterprise and includes modern hotels, bungalow cabins, chalets, lodges and cottages. To stimulate the provision of adequate tourist accommodation, modern cabins are being provided in several of the Parks to be leased to concessionaires who undertake to offer low-rental accommodation to park visitors. Rail, highway and air transportation systems serve the National Parks and there is a well-maintained network of roads and trails within the Park boundaries.

A Park warden service protects the forests and wildlife and maintains constant vigilance for the safety and comfort of visitors. Stocking and transfer of game fish in order to improve angling opportunities are carried out quite extensively and

\* Prepared under the direction of R. A. Gibson, Director, Development Services Branch, Department of Resources and Development.

successfully; fish hatcheries are operated in three of the mountain National Parks. Two of the Parks—Elk Island in Alberta, and Wood Buffalo lying across the boundary between Alberta and the Northwest Territories—are largely big-game preserves where fine herds of buffalo and other species find sanctuary. Elk Island has, in addition, become a popular summer resort and is being developed as a recreational area.

Besides the scenic, recreational and wild animal parks, Canada has nine national historic parks, mostly in the Eastern Provinces. These are described in the tabulation below. In addition, the National Parks and Historic Sites Service is responsible for the marking, preservation and restoration of places of great historic interest in Canada. Nearly 400 such sites have been marked on the recommendation of the Historic Sites and Monuments Board of Canada. Many other sites deemed worthy of commemoration have been recommended by the Board and suitable action is pending in these cases.

### 3.—Locations, Date Established, Areas and Characteristics of National Parks

Park	Location	Date Established	Area	Characteristics
			sq. miles	
<b>Scenic and Recreational Parks</b>				
Banff.....	Western Alberta, on east slope of Rockies.	1885	2,564.0	Magnificent scenic playground containing noted resorts, Banff and Lake Louise. Mineral hot springs; summer and winter sports. Accessible by rail, highway and air. Hotel and bungalow cabin accommodation. Equipped camp-grounds.
Yoho.....	Eastern British Columbia, on west slope of Rockies.	1886	507.0	Lofty peaks, magnificent waterfalls, colourful lakes. Yoho and Kicking Horse Valleys. Accessible by rail and highway. Hotel and bungalow cabin accommodation. Equipped camp-grounds.
Glacier.....	Southeastern British Columbia, on summit of the Selkirk Range.	1886	521.0	Superb alpine region, towering peaks, glaciers and forests. Accessible by rail only. Climbing, skiing, camping.
Waterton Lakes.....	Southern Alberta, adjoining Glacier Park in Montana, U.S.A.	1895	204.0	Canadian section, Waterton-Glacier International Peace Park. Mountain playground with colourful peaks and charming lakes. Accessible by highway. Hotel and bungalow cabin accommodation. Equipped camp-grounds.
Jasper.....	Western Alberta, on east slope of Rockies.	1907	4,200.0	Mountain playground and noted wildlife sanctuary. Majestic peaks, ice-fields, beautiful lakes and famous resort, Jasper. Mineral hot springs, summer and winter sports. Accessible by rail, highway and air. Hotel and bungalow cabin accommodation. Equipped camp-grounds.
Mount Revelstoke. . .	Southeastern British Columbia, on west slope of Selkirks.	1914	100.0	Rolling mountain-top plateau. Colourful alpine meadows. Accessible by rail and highway. Summer accommodation in park; all-year accommodation in town of Revelstoke. Championship ski runs and ski jump. Equipped camp-grounds.
St. Lawrence Islands.	In St. Lawrence River between Morrisburg and Kingston, Ont.	1914	189.4 (acres)	Mainland area and 13 islands among Thousand Islands. Recreational and camping area. Accessible by highway; by boat from nearby mainland points.

3.—Locations, Date Established, Areas and Characteristics of National Parks—  
continued

Park	Location	Date Estab- lished	Area  sq. miles	Characteristics
<b>Scenic and Recreational Parks—con.</b>				
Point Pelee.....	Southern Ontario, on Lake Erie.	1918	6.0	Recreational area. Remarkable beaches, southern flora. Resting place for mi- gratory birds. Accessible by highway. Hotel and bungalow cabin accommoda- tion. Equipped camp-grounds.
Kootenay.....	Southeastern British Columbia, on west slope of Rockies.	1920	543.0	Encloses Vermilion-Sinclair section o Banff-Windermere Highway. Broad valleys, deep canyons, mineral hot springs. Hotel and bungalow cabin accommodation. Equipped camp- grounds.
Prince Albert.....	Central Saskat- chewan, north of Prince Albert.	1927	1,496.0	Forested region dotted with lakes and interlaced with streams. Summer play- ground and recreational area. Accessible by highway. Hotel and bungalow cabin accommodation. Equipped camp- grounds.
Riding Mountain....	Southwestern Mani- toba, west of Lake Winnipeg.	1929	1,148.0	Playground and wildlife sanctuary on summit of escarpment. Fine lakes. Accessible by highway. Hotel and bungalow cabin accommodation. Equip- ped camp-grounds.
Georgian Bay Islands	In Georgian Bay, north of Midland, Ont.	1929	5.4	Recreational and camping area. Unique pillars on Flowerpot Island. Accessible by boat from nearby mainland points. Equipped camp-grounds and annual youth camps on Beausoleil Island.
Cape Breton High- lands.	Northern part of Cape Breton Is- land, N.S.	1936	390.0	Rugged Atlantic coast line with mountain background. Fine seascapes. Recrea- tional opportunities. Hotel and bungalow cabin accommodation. Equipped camp- grounds.
Prince Edward Island.	North shore of Prince Edward Island.	1937	7.0	Strip 25 miles long on shores of the Gulf of St. Lawrence. Recreational area, fine bathing beaches. Accessible by high- way. Hotel and bungalow cabin accom- modation. Equipped camp-grounds.
Fundy.....	On Bay of Fundy between Moncton and Saint John in New Brunswick.	1948	80.0	Delightful recreational area. Forested region, wildlife sanctuary, rugged terrain.
<b>Wild Animal Parks</b>				
Elk Island.....	Central Alberta, near Edmonton.	1913	75.0	Fenced preserve containing large herd of buffalo; also deer, elk and moose. Pop- ular recreational area. Accessible by highway. Bungalow cabin accommoda- tion and equipped camp-grounds.
Wood Buffalo <sup>1</sup> .....	Partly in Alberta and partly in Northwest Terri- tories, between Athabaska and Slave Rivers.	1922	17,300.0	Immense region of forests and open plains. Home of largest remaining herd of bison on the Continent. Other wildlife abund- ant.

<sup>1</sup> Administered by the Northern Administrations Division, Development Services Branch, Depart-  
ment of Resources and Development.

### 3.—Locations, Date Established, Areas and Characteristics of National Parks—concluded

Park	Location	Date Established	Area	Characteristics
<b>Historic Parks</b>			acres	
Fort Anne.....	Nova Scotia, at Annapolis Royal.	1917	31.0	Site of early Acadian settlement. Museum and well-preserved earthworks.
Fort Beauséjour.....	New Brunswick, near Sackville.	1926	81.0	Site of French fort erected in middle of 18th century. Museum.
Fortress of Louisbourg.	Cape Breton Island, N.S., 25 miles from Sydney.	1941	340.0	Ruins of walled city erected by the French, 1720-40. Interesting excavations. Museum.
Port Royal.....	Lower Granville, N.S., 8 miles from Annapolis Royal.	1941	17.0	Restoration of "Habitation" or first fort built in 1605 by Champlain, DeMonts and Poutrincourt.
Fort Chambly.....	Chambly, Que.....	1941	2.5	French fort on Richelieu River, first built in 1665. Museum.
Fort Lennox.....	Ile-aux-Noix, Que., near St. Johns.	1941	210.0	Site of early French fort built in 1759.
Fort Wellington.....	Prescott, Ont.....	1941	8.5	Defence post built 1812-13. Museum.
Fort Malden.....	Amherstburg, Ont.	1941	5.0	Site of defence post built 1797-99. Museums.
Fort Prince of Wales..	Northern Manitoba, near Churchill.	1941	50.0	Ruins of fort built 1733-71 to secure control of Hudson Bay for England.

**Provincial Parks.**—In addition to the National Parks already described, most of the provinces have established Provincial Parks. These parks, as in the case of the National Parks, are areas of great scenic or other interest maintained for the benefit of present and future generations. The Provincial Parks are administered by the Provincial Governments concerned and in most cases they have not yet reached the degree of development which marks the National Parks. In Prince Edward Island, Nova Scotia, New Brunswick and Manitoba there are no Provincial Parks.

### 4.—Locations, Date Established, Areas and Characteristics of Provincial Parks

Province and Park	Location	Date Established	Area	Characteristics
			acres	
<b>Newfoundland—</b> Serpentine.....	South of Humber Arm, west coast.	1939	26,880	Undeveloped.
<b>Quebec—</b> Laurentides.....	25 miles north of Quebec City, on both sides of Quebec-Chicoutimi highway.	1895	2,373,120	Altitude 3,000 ft., numerous lakes, tumultuous rivers. Speckled trout, moose, deer, black bears, wolves, etc. No hunting. Two hotels and 20 fishing camps.
Trembling Mountain.	80 miles north of Montreal. Mont-Tremblant Village close to the southern section of Park.	1895	770,500	Famous resort area, both summer and winter. Ski school and lifts, 40 miles of ski trails, 9 ski-slopes. Lac Tremblant 750 ft. Highest peak Mont-Tremblant, 3,100 ft.

4.—Locations, Date Established, Areas and Characteristics of Provincial Parks—

<b>Quebec—concl.</b>				
Gaspeian.....	Gaspe Peninsula.....	1937	320,000	Established to preserve caribou and wildlife on south side of St. Lawrence. Accessible from Ste. Anne des Monts and Gaspe. Speckled trout; 2 fishing camps. Includes the highest peaks of the Shickshock Mountains. Highest peak Mount Jacques - Cartier, 4,200 ft.
Mount Orford.....	On Orford Mountain, 15 miles west of Sherbrooke.	1938	9,970	Altitude 2,860 ft. Skiing and golfing in season.
Parc de Lavérendrye.	In western part of Province 140 miles northwest of Montreal on both sides of route Montreal-Abitibi.	1939	1,732,000	Altitude 1,200 ft. Numerous lakes and rivers. Trout, pike, pickerel and bass. Two establishments to accommodate travellers and stopping place maintained by Department of Game and Fisheries.
Chibougamau Fish and Game Reserve.	30 miles west of Lake St. John. Strip 80 miles long on both sides of Lake Chibougamau highway.	1946	1,088,000	Altitude 1,300 ft. Numerous lakes and rivers. Trout, pike and pickerel.
<b>Ontario—</b>				
Algonquin.....	In southeastern Ontario in the District of Nipissing and the County of Haliburton, 141 miles north of Toronto, 105 miles west of Ottawa.	1893	1,754,240	Wilderness area, wildlife preserve. Hotels, summer cottage sites, camping facilities, canoe trips, fishing, bathing.
Rondeau.....	In southwestern Ontario in the County of Kent, 20 miles southeast of Chatham, 70 miles east of Windsor.	1894	5,120	Partly cultivated, fine timber stands. Enclosed and wild animals. Fishing, duck - hunting, camping facilities, summer cottage sites, restaurant, store, dance pavilion, other recreational facilities.
Quetico.....	In northwestern Ontario in the Rainy River district. Southern boundary adjoins the International Boundary midway between Port Arthur and Fort Frances.	1913	1,190,400	Wilderness area, wildlife preserve. Camping facilities, canoe trips, fishing.
Ipperwash Beach..	In southwestern Ontario in the County of Lambton, on Lake Huron, 100 miles north of Windsor, 50 miles north of Chatham.	1937	109	Sand beach, woodland area. Fishing, camping facilities, bathing.
Lake Superior.....	In northeastern Ontario in the District of Algoma, on Lake Superior, 70 miles (approx.) north of Sault Ste. Marie.	1944	345,600	Wilderness area, wildlife preserve. Fishing.
Sibley.....	In northwestern Ontario in the Thunder Bay district. On north shore of Lake Superior, 40 miles northeast of Port Arthur and Fort William.	1944	40,320	Wilderness area, wildlife preserve.

#### 4.—Locations, Date Established, Areas and Characteristics of Provincial Parks— continued

Province and Park	Location	Date Estab- lished	Area	Characteristics
<b>Saskatchewan—<sup>1</sup></b>			acres	
Cypress Hills....	South of Maple Creek near International Boundary.	1932	10,880	Forest area. Bungalow, lodge and cabin accommodation, auto camp.
Duck Mountain...	15 miles northeast of Kam- sack.	1932	51,840	Forest and lake area. Beaches. Fish and wild life.
Good Spirit Lake.	20 miles west of Canora...	1932	3,827	Camp and picnic grounds. Fishing, swimming.
Greenwater Lake.	North of Kelvington.....	1932	22,240	Forest and lake area. Swimming, fishing.
Little Manito....	On Manitou Lake.....	1932	238	Medicinal waters. Chateau, cabin and tourist accommodation.
Moose Mountain...	15 miles north of Carlyle.	1932	98,560	Lake area. Poplar and white birch stands. Fishing.
Nipawin.....	35 miles northwest of Nipawin.	1934	161,280	Lodgepole pine stands. Camping, trout fishing.
Lac La Ronge....	190 miles north of Prince Albert.	1939	729,600	Lake area. Spruce and poplar stands. Tourist accommodation, trout fish- ing.
<b>Alberta—<sup>1</sup></b>				
Ghost River.....	On Ghost and Bow Rivers west of Calgary.	1930	536	Artificial lake. Cottages and picnic ground.
Saskatoon Moun- tain Reserve.	In Grande Prairie district.	1930	3,000	Mountain lookout.
Writing-on-Stone Reserve.	On Milk River east and north of Coutts.	1930	796	Natural obelisks with undeciphered hieroglyphics. Summer village.
Saskatoon Island. Bad Lands Reserve.	West of Grande Prairie... North of Drumheller....	1932 1934	250 1,800	Picnic ground. Fossilized remains of prehistoric animals.
Elkwater Lake...	On south shore of lake at foot of Cypress Hills.	1947	378	Cottages, recreation and camp grounds. Limited accommodation for transients.
Crimson Lake....	9 miles northwest of Rocky Mountain House.	1948	900	Cottages. Swimming, fishing, picnic and sports ground.
Red Lodge.....	9 miles west of Bowden on Little Red Deer River.	1948	45	Swimming. Picnic and sports ground.
Kinbrook Island..	Island in Lake Newell, 9 miles south of Brooks.	1949	90	Island connected by causeway to lake shore. Boating and swimming; re- creation and picnic grounds.
<b>Br. Columbia—<sup>1</sup></b>				
Strathcona.....	Campbell River, Van- couver Island.	1911	529,920	Oldest B.C. Provincial Park, situated in the rugged centre of Vancouver Island. Many glaciers, alpine me- adows and lakes. Della Falls, one of the world's highest. Undeveloped and mostly inaccessible.
Mt. Robson.....	Mt. Robson, adjacent to Jasper Park.	1913	513,920	Rocky Mountain park featuring Mt. Robson, highest peak in the Cana- dian Rockies, Berg Lake and im- pressive glaciers. Access to Berg Lake Camp by horse trail.

<sup>1</sup> Excludes 1 park in Saskatchewan, 16 parks in Alberta and 26 parks in British Columbia which are mainly of local interest. (See pp. 26-30 of the 1950 Year Book.)

#### 4.—Locations, Date Established, Areas and Characteristics of Provincial Parks— continued

Province and Park	Location	Date Estab- lished	Area	Characteristics
			acres	
<b>Br. Columbia— con.</b>				
John Dean.....	Sidney, near Victoria, Vancouver Island.	1921	98	Mountain viewpoint overlooking Saanich Peninsula and Gulf Islands. Primeval forests and wild flowers. Picnic grounds and hiking trails. Accessible by road.
Kokanee.....	Near Nelson, B.C.....	1922	64,000	High mountain park featuring Kokanee Glacier and several scenic lakes. Fishing, mountaineering and skiing. Poor road and trail access.
Mt. Assiniboine...	South of Banff.....	1922	12,800	An outstanding area of Rocky Mountain scenery. Mt. Assiniboine and small lakes. Hiking, riding, fishing, skiing. Access by horse trail.
Nakusp Hot Spring.	Nakusp, Arrow Lakes, southeast B.C.	1925	127	Hot springs. Access by 8 miles of trail.
Sir Alexander MacKenzie.	Ocean Falls, west coast...	1926	13	Historic monument commemorating end of Sir Alexander MacKenzie's famous overland journey. Accessible by boat.
Garibaldi.....	Haney - Squamish, lower mainland, north of Van- couver.	1927	612,615	Outstanding scenic park with mountain lakes, peaks and glaciers, flower meadows and interesting geological features. Potential winter sports area. Access by trail from several points on the Pacific Great Eastern Railway.
Sooke Mountain...	Victoria, Vancouver Island	1928	1,446	Undeveloped mountain park.
Keremeos Columns.	Keremeos, south central B.C., near U.S. border.	1931	720	A columnar geological formation; not readily accessible.
Beatton.....	Fort St. John, northeast B.C., near Alberta boundary.	1934	770	Community picnic ground. Fishing.
Mt. Seymour.....	North Vancouver, lower mainland, B.C.	1936	9,156	Mountain. Winter-sport park with summer hiking, swimming and berry picking. Highway under construction.
Clearwater.....	Hedley, south central B.C.	1938	260	Scenic mountain lake. Fishing. Poor road.
Crescent Beach....	Crescent Beach, lower mainland near U. S. border.	1938	237	Ocean beach. Road access.
Mt. Bruce.....	Salt Spring Island, south coast near Victoria.	1938	480	Undeveloped forest park.
Mt. Maxwell.....	Salt Spring Island, south coast near Victoria.	1938	492	Undeveloped forest park with scenic lookout.
Tweedsmuir.....	Bella Coola, Burns Lake..	1938	3,456,000	One of the larger wilderness areas in North America. Scenic boat tours and trail rides. Fishing, hunting.
Peace Arch.....	White Rock, B.C., and Blaine, Wash., Interna- tional Boundary.	1939	16	Landscaped international park featuring Peace Arch. Picnic grounds. King George VI Highway.
Wells Grey.....	North of Kamloops, B.C..	1939	1,164,960	Undeveloped lake and mountain park. Fishing and hunting. Access, poor road and trail.

#### 4.—Locations, Date Established, Areas and Characteristics of Provincial Parks—concluded

Province and Park	Location	Date Established	Area	Characteristics
			acres	
<b>Br. Columbia—</b> concl. Chasm.....	Clinton, central B.C.....	1940	315	Outstanding geological feature, a great chasm in the Interior Plateau, adjacent to the Caribou Highway.
Elk Falls.....	Campbell River, east coast Vancouver Island.	1940	2,558	A series of cascades and falls on Campbell River. Stand of giant firs. Adjacent to hydro-electric installations.
Englishman's River.	Parksville.....	1940	240	Forest area traversed by a picturesque river containing falls and canyons. Picnic ground, swimming, camping and hiking. Accessible by highway.
Little Qualicum Falls.	Qualicum Beach, adjacent to Alberni-Parksville Highway.	1940	207	Forest area traversed by a picturesque river containing falls and canyons. Picnic ground, swimming, camping and hiking. Accessible by highway.
Silver Star.....	Vernon, Okanagan, south central B.C.	1940	21,888	Interior mountain park. Alpine scenery, berry picking, skiing. Poor road access.
Stamp Falls.....	Alberni, Vancouver Island.	1940	424	Forest park with river falls, fish ladder and swimming pool. Picnic grounds, camping. Road access.
Hamber.....	Big Bend Highway. Park adjoins Jasper and Banff.	1941	2,431,960	Undeveloped forest and mountain area bordering easterly portion of Big Bend Highway.
Manning.....	Hope-Princeton Highway south central B.C., near International Boundary.	1941	181,760	A mountain park featuring Alpine flower meadows and scenic fishing lakes. Wildlife sanctuary. Accessible by highway.
Darke Lake.....	Summerland, South Okanagan.	1943	5,472	Typical scenic group of interior mountain lakes. Fishing, hunting and boating.
McMillan.....	Cameron Lake, Vancouver Island.	1944	337	World-famous stand of virgin west-coast forest, accessible on the Alberni-Parksville Highway.
Cultus Lake.....	Chilliwack, Fraser Valley, lower mainland.	1948	950	Summer park. Swimming, picnicking, fishing. Road access.

Tow Hill.....	Queen Charlotte Island...	1948	480	Largely undeveloped park. Picnic ground.

### Section 3.—Parks and Other Areas under the Federal District Commission\*

The Federal District Commission, known as the Ottawa Improvement Commission previous to 1927, was established by Parliament in 1899 for the beautification and improvement of the city of Ottawa, Canada's Capital, by the construction and maintenance of parks and driveways.

In 1927 the scope of the Commission's operations was widened to include the adjoining districts, and its membership increased from eight to ten, including a representative of the city of Hull, Que. Subsequently the Commission was given

\* Revised by the Federal District Commission, Ottawa.

the additional responsibility of maintaining the grounds of all Federal Government Buildings at Ottawa and vicinity. By amendment to the Federal District Commission Act, 1946, the membership of the Commission was increased to nineteen, and made more national in its composition by the inclusion of a representative from each province of Canada.

Departments of the Federal Government from time to time ask the Commission to carry out improvements to the grounds of newly constructed Government buildings on the basis of full reimbursement for the actual costs entailed. The Commission has the trained personnel and the special equipment required for such work. Funds for the purposes of the Commission are provided by statutory grants and votes of Parliament.

In the cities of Ottawa and Hull and immediate environs, an area comprising 1,878 acres is administered by the Commission and eighteen parks have been developed. Twenty-two miles of landscaped driveways have been built and are being maintained. In addition, the large and beautiful area known as Gatineau Park, described below, has been established in the Laurentian Hills.

**Gatineau Park.**—Gatineau Park, situated in the Province of Quebec about eight air miles from the Federal Capital, is the only National Park administered and controlled by the Federal District Commission. It comprises at present about 24,000 acres of wooded hills, valleys, lakes and streams located in the southerly fringe of the Laurentians, the oldest mountains in Canada, and is being preserved in its natural state for the enjoyment of the public.

The Park is a game sanctuary. Deer, bear, fox, beaver, mink, raccoon and other fur-bearing animals are quite numerous. Well-located trails, picnic spots and camping sites have been provided for the pleasure and healthful recreation of the public. Gatineau Park furnishes excellent opportunities for the enjoyment of skiing and is the principal centre in the Ottawa district for this popular winter sport.

Further development of this area is planned which will include an addition of 26,000 acres, overnight cabins, administration buildings, shelters, refectories, bath-houses and other structures.

The Park is administered by a Superintendent and a force of five rangers who act also as game wardens, police constables and fire guards.

**The National Capital Plan.**—The Master Plan to guide the long-range development of Ottawa and the 900 square mile National Capital District, which will create a Capital in keeping with Canada's achievements and status as a nation, was completed at the end of 1948. The preliminary report of the National Capital Planning Committee and the Federal District Commission was tabled in the House of Commons on Apr. 30, 1949, and an outline of the Plan is given at pp. 18-20 of the 1950 Year Book.

The first contract under the Plan was let on Apr. 26, 1950, for the construction of a bridge connecting Elgin and Waller Streets and spanning the Driveway, the Rideau Canal, the railway tracks and Nicholas Street. The total length of this bridge will be approximately 2,000 ft. It will serve to relieve traffic congestion in Confederation Square and remove commercial traffic from Wellington Street.

Tenders were also called in the spring of 1950 for the construction of a railway cut-off line south of the built-up area of the city. The completion of this cut-off will permit the removal of the cross-town railway tracks.

## Section 4.—Wildlife Resources and Conservation\*

**The Canadian Wildlife Service.**—The Canadian Wildlife Service of the Development Services Branch, Department of Resources and Development, is responsible for attending to wildlife matters coming within the jurisdiction of the Federal Government of Canada, except those within the purview of the National Museum and certain activities closely related to Indian Affairs.

Its functions include conservation and management of wildlife in the Northwest Territories; advising and co-operating with the National Parks and Historic Sites Division regarding fish and wildlife problems in the National Parks of Canada; and administration of the Migratory Birds Convention Act (in conjunction with the Royal Canadian Mounted Police and in co-operation with the provincial game authorities), the Northwest Game Ordinance and the Fur Export Ordinance (Northwest Territories). The Canadian Wildlife Service also handles national and international problems relating to Canada's wildlife resources, and co-operates with governmental and other agencies having similar interests and problems in Canada and elsewhere.

The Service issues permits for bird-banding in Canada, and is the Canadian clearing-house for bird-banding information. It issues permits to qualified persons to take migratory birds for scientific purposes. It also issues permits to take and possess migratory birds for propagating purposes; to collect eiderdown; to use firearms or other equipment for the control of migratory birds causing damage to agricultural, fishing or other interests; and to engage in the business of taxidermy.

The Canadian Wildlife Service plans and carries out scientific investigations concerning numbers, food, shelter, migration, reproduction, diseases, parasites, predators, competitors and uses of wild creatures in Canada. In certain of such investigations, e.g., the mid-winter waterfowl inventory, it works in close co-operation with United States authorities conducting parallel studies.

The Service is responsible for establishment and administration of bird sanctuaries under the Migratory Birds Convention Act. On Dec. 31, 1949, there were 76 of these sanctuaries, with a total area of 1,800 square miles.

The Limnology Section of the Service concerns itself with the maintenance and improvement of sport fishing, the control of aquatic and semi-aquatic insects, the control of algæ, and other biological problems that arise in regard to water areas in the National Parks. It also acts in an advisory capacity to the Northern Territorial Administrations in connection with aquatic biological matters.

### MIGRATORY BIRD PROTECTION IN CANADA

Canada includes within its borders a great variety of climatic and geographical conditions suitable for wildlife habitat in the temperate and frigid zones. Consequently, when first discovered by European explorers, Canada exhibited a remarkable variety and richness of bird and animal life adapted to these diverse conditions. The profusion of wildlife was in those early days practically unaffected by the primitive hunting methods of the aboriginal inhabitants, whose food and clothing requirements were largely supplied by the products of the chase.

The progress of exploration and colonization, radiating from small coastal settlements begun in the 17th century, made tremendous inroads on the wildlife resources of Canada. Wild animals and birds were driven out of wide areas by forest-clearing and cultivation of the soil. The process was accelerated during the

\* Prepared under the direction of Dr. H. L. Keenleyside, Deputy Minister, Department of Resources and Development, in the Canadian Wildlife Service.

19th century when rapidly growing population and more efficient killing methods brought about an annual slaughter—for food, clothing, commercial exploitation or even wanton love of destruction—far in excess of the natural increase. Some species were almost or entirely exterminated, and others saved only by the extent and inaccessibility of the wilderness to which their survivors retreated.

Fortunately the same process of colonization which initiated this slaughter of wildlife operated, in course of time, to check it. The development of agriculture and industry made the new population less dependent on the wild resources of the country than the pioneer settlers had been. The growth of urban civilization favoured the spread of humane and thoughtful sentiments, of the realization that the creatures of the woods and lakes formed a natural resource of æsthetic and economic value, and of the knowledge that these creatures are ours to preserve and use wisely as a sacred trust and not to destroy. At first these sentiments met with strong opposition, particularly on the outer fringes of settlement; but they made steady progress, and for many years they have been accepted by the great majority of Canadian people and have been made the basis of policy regarding wildlife resources by all governments of Canada.

**Migratory Birds in Canada.**—More than five hundred different species of birds have been recorded in Canada. Omitting the few species that have been represented only by accidental visits of individuals, we may classify these birds roughly in three groups:—

- (1) Birds that are permanent residents of certain regions.
- (2) Birds that spend the season for nesting and rearing of young in one part of Canada (a central or northern area), and the colder months in another part of Canada (a coastal or southern area) where the climate is more favourable.
- (3) Birds that nest and rear their young in Canada and migrate to spend the winter months in more southerly countries, principally in the United States.

On account of the winter climate experienced over the greater part of Canada, the majority of Canadian birds—both species and individuals—fall into the third group of the above classification. Birds of this group belong, as a rule, to the species of greatest economic and æsthetic value, e.g., most kinds of ducks, geese and swans and of insectivorous birds and many sea birds.

For this reason, the question of protection of bird life in Canada is not merely national in its scope, but has important international ramifications; it is particularly affected by Canada's relations with the United States. In the early years of settlement, the conditions which decimated the wild-bird population were very similar in Canada and the United States. The growth of humane sentiments followed a parallel course in both countries, and in recent years the community of interests and the firm friendship existing between them have been of inestimable value in working out schemes of bird protection whereby each nation co-operates with and complements the work of the other.

**Migratory Birds Convention Act.**—Up to 1916, many laws of merely local effect had been passed in different parts of Canada and the United States for the protection or regulation of hunting of migratory birds. A handicap affecting all such laws was caused by the very nature of bird migration. The regular spring and autumn movements of ducks, for example, meant that the period of greatest concentration of these birds fell at a different time of the year in States and Provinces in different latitudes. Local laws, naturally, fixed duck-hunting seasons to cor-

respond with the dates of greatest local abundance. Consequently, in spite of well-intentioned regulations for game protection, these birds were subjected to continuous hunting over almost the whole of their migration route and during unbroken periods of long duration.

In the early 20th century, it became clear to thoughtful observers in Canada and the United States that unless a co-ordinated scheme of protection was worked out by both countries many valuable species of migratory birds would become extinct. The problem was recognized as an international one and many difficulties had to be overcome before a solution could be found. Finally, the labours of conservationists and statesmen on both sides of the Border were crowned with success by the signing of the Migratory Birds Treaty at Washington on Aug. 16, 1916.

The Migratory Birds Treaty between Canada and the United States may be considered the most important document in the history of wildlife conservation. It established for Canada and the United States (subject to ratification by their respective legislative bodies) the principles of protection of migratory birds. It limited the length of shooting seasons for migratory game birds, and it protected most other migratory bird species not classed as game, with provision for collection of specimens for scientific purposes and for control of birds causing damage.

On Aug. 29, 1917, the Parliament of Canada, by adoption of the Migratory Birds Convention Act, approved the Migratory Birds Treaty and ensured its execution in Canada.

On Apr. 23, 1918, Regulations for carrying out the provisions of the Migratory Birds Convention Act were formulated by Order in Council. These Regulations established annual close seasons, varying according to locality and species, for migratory game birds, but provided that Indians and Eskimos might take scoters for food only, at any season.

Under these Regulations migratory insectivorous birds and migratory non-game birds receive permanent protection, again with an exception in favour of Indians and Eskimos, who may at any season take auks, auklets, guillemots, murres and puffins and their eggs for human food and for the use of the skins of these birds for clothing. Special protection in the form of five-year and ten-year close seasons was afforded to a few species of game birds. In some cases, e.g., with regard to swans, cranes and most shore birds, these prolonged close seasons have been repeatedly extended so that the birds receive virtually permanent protection.

The Regulations also provide for the creation by the Government of Canada of bird sanctuaries, which are areas of special protection. Within a bird sanctuary, even the possession of a firearm or other appliance used for killing or capturing birds or the allowing of a cat or dog to run at large, except under special authorization, is prohibited. In approved instances individuals may be given permits to take a limited number of specimens for scientific use or to carry a firearm for the destruction of predatory animals. When a bird sanctuary includes private property, the regulation regarding cats and dogs may be waived to obviate hardship to their resident owners.

The administration of the Migratory Birds Convention Act, including establishment and control of bird sanctuaries under the Act, is carried on by the Canadian Wildlife Service of the Development Services Branch, Department of Resources and Development, in conjunction with the Royal Canadian Mounted Police and in co-operation with the provincial game authorities.

**Migratory Bird Sanctuaries.**—Before the Migratory Birds Convention Act was passed, there had been in Canada a number of public and private wildlife sanctuaries, parks and game preserves, within which a degree of protection was afforded to all non-injurious forms of wildlife. The first—and, for over 30 years, the only—bird sanctuary established by the Government of Canada was at Long Lake in the Northwest Territories (now known as Last Mountain Lake, in the Province of Saskatchewan). An area of 2,500 acres in this district was, on June 8, 1887, “reserved from sale and settlement, and set apart as breeding grounds for wild fowl”. In 1921 this sanctuary, under the name of Last Mountain Lake Bird Sanctuary, was extended in area and brought under the provisions of the Migratory Birds Convention Act. It was transferred in 1930 to the Province of Saskatchewan, which still maintains it.

The first bird sanctuaries to be set up under the Migratory Birds Convention Act were the Bonaventure Island-Percé Rock Bird Sanctuary and the Bird Rocks Bird Sanctuary. Both of these were authorized by the Federal Government on Mar. 29, 1919, after having been created by an Act of the Legislature of the Province of Quebec.

*The Bonaventure Island—Percé Rock Bird Sanctuary.*—This Sanctuary consists of two parts, Percé Rock and the cliffs of Bonaventure Island, lying off the eastern tip of the Gaspé Peninsula in the Gulf of St. Lawrence. The combined land area is small (only 32 acres) but the sanctuary is important, not only because of its historic priority but because of its quality as a bird refuge.

Percé Rock is a limestone mass a few hundred yards off shore, about 1,500 feet long and 300 feet wide, with an isolated column close to its seaward end. The sides of the rock rise perpendicularly out of the sea to a maximum height of 288 feet. These cliffs are unscalable by man and inaccessible to predatory animals, thus making the area on top of the rock a refuge of unequalled security for sea birds. The rock gained its name from the fact that it was formerly pierced by two or more great archways. Only one of these archways now remains, collapse of another during the 19th century having produced the isolated column mentioned above. All sea waters within one mile of Percé Rock are included in the sanctuary area.

During the nesting and brood-rearing season the top of Percé Rock is the abode of hundreds of double-crested cormorants and herring gulls, while small numbers of kittiwakes and guillemots nest on the sides of the Rock.

The other part of this sanctuary consists of the cliffs on the seaward side of Bonaventure Island, about three miles from Percé Rock. These cliffs, about a mile and a quarter in length, are composed of red sandstone and attain a height of about 250 feet.

The Bonaventure Island cliffs are pre-eminently the nesting-place of gannets. The number of gannets here, formerly exceedingly large, had decreased to a low point of 8,000 in 1919. Twenty-eight years of sanctuary protection increased the number to 18,000 in 1947, making this one of the four largest gannet colonies in the world. The cliffs are also used as nest-sites by herring gulls, black guillemots and other sea birds.

Both Percé Rock and the Bonaventure Island cliffs can be closely viewed by visitors coming in boats from the neighbouring mainland. In consequence, this sanctuary is a famous tourist attraction, and has had an incalculable effect in spreading interest in bird life and its conservation.

*The Bird Rocks Bird Sanctuary.*—This Sanctuary consists of two sea-washed rocks in the central part of the Gulf of St. Lawrence. These rocks were discovered in 1534 by Jacques Cartier, who noted enormous numbers of gannets there. Some authorities have estimated that as late as the early 19th century more than half of the world population of gannets nested on the Bird Rocks—a unique concentration of bird life, because the exposed area of the rocks is given in the earliest records as only 14 acres and has since been reduced by erosion to less than half that size.

Their small area and isolated situation did not protect the Bird Rocks from raids by fishermen and others on the birds and their eggs. These raids became fewer after a lighthouse was erected on the larger rock in 1869, but the construction of the lighthouse and associated buildings seriously reduced the available nesting area. The bird population was at a critically low point in 1919 when the sanctuary was set up to include the exposed rocks and all surrounding waters to a distance of one mile.

Although now protected from human enemies, the gannet colony on Bird Rocks can never recover its former magnitude. In 1860 it was estimated to contain 100,000 individuals, but in 1932, after 13 years of protection, the number was placed at only 1,000. Rapid erosion of one of the rocks is believed to have forced part of the gannet population to found a new colony on Anticosti Island, 92 miles distant. In view of the history of erosion, the future of the colony is somewhat problematical.

*Other Sanctuaries.*—Since the establishment of the two pioneer sanctuaries under the Migratory Birds Convention Act in 1919, scarcely a year has passed without one or more new bird sanctuaries being established. An interesting feature is that the creation of many of these sanctuaries was initiated by private citizens, who voluntarily petitioned to have their property placed under the sanctuary restrictions. Such public spirit is admirable and has been of particular aid to the cause of conservation because Federal Government policy is not to establish sanctuaries on private property without full consent of the owners. These sanctuaries on privately owned land vary greatly in extent: the smallest is Rideau Island Bird Sanctuary, covering only one acre, within the limits of the city of Calgary, Alberta; and the largest is Harrington Lake Bird Sanctuary near Ottawa, where a number of property-owners have co-operated to make eight square miles of forest, lake and cultivated land into a peaceful habitat for many species of aquatic and insectivorous birds.

Sanctuaries established on Crown lands are, in general, much larger than those on private property and often consist of tidal-water areas, with or without islands or adjacent portions of the mainland being included. An example of this type is the Port Joli Bird Sanctuary near the southern extremity of Nova Scotia: it consists of tidal-water areas in three separate inlets, including islets and rocks in those areas but not including any part of the mainland. Unlike many other migratory bird sanctuaries in Canada, this one has a year-round value, climatic conditions permitting its use throughout the winter by aquatic birds which nest in more northerly parts of Canada.

The largest migratory bird sanctuary in Canada consists of part of Akimiski Island, in James Bay, and the waters bordering it. This Sanctuary covers 1,300 square miles, of which land and fresh-water lakes constitute slightly more than one-half. Two other sanctuaries, covering mainland and tidal-water areas in the southeast quarter of James Bay, are respectively 68 and 110 square miles in extent.

Ducks and geese, which assemble on migration in these remote and sparsely populated areas, required special measures for their protection when the construction of a railway from southern Ontario to James Bay and the increasing use of aircraft led to intensive hunting there. The three large sanctuaries mentioned have proved to be of inestimable value in maintaining the stock of these game birds.

On rare occasions, it may be advisable to cancel a bird sanctuary but, in the main, sanctuaries are permanent. An example of a cause for cancellation is the drying up of a marsh area formerly used by waterfowl for nesting or breeding. Cancellation of the sanctuary would then free the area for agricultural or other purposes. Such cancellations have occurred on a few occasions but only after the most careful investigation has proved that the value of the area as a bird sanctuary has been permanently impaired.

On Dec. 31, 1949, there were in Canada 76 bird sanctuaries controlled by the Government of Canada under the Migratory Birds Convention Act, scattered over the country from Atlantic to Pacific and occupying a total area of about 1,800 square miles. This area may appear small in relation to Canada's total area of nearly 4,000,000 square miles, but it must be borne in mind that the majority of migratory birds are given absolute protection at all times and in all parts of the country, and that hunting is prohibited in national and provincial parks, provincial game preserves and sanctuaries, and other restricted areas, while hundreds of thousands of square miles in the Northwest Territories are so thinly populated that within them wildlife suffers little molestation.

The special protection afforded by Canadian migratory bird sanctuaries, many of which are strategically located at selected points on the great migration routes and in favourable breeding areas, is and will continue to be an important factor in the preservation of wild bird life in North America.

## PART VI.—CLIMATE, METEOROLOGY, ETC.

### Section 1.—Climate

At pp. 41-62 of the 1948-49 edition of the Year Book there appears an up-to-date treatment of the Climate of Canada, Part I. Detailed tabulations for climatic factors covering a wide range of stations across Canada were published as Part II at pp. 35-70 of the 1950 Year Book. This material will not undergo revision for some time since the general characteristics of climate do not change rapidly and the tables were built up on the basis of long-term averages extending back in most cases for 50 years or more.

Table 1, p. 44, gives temperature and precipitation data for 35 representative stations in Canada.

### Section 2.—Meteorology

See list at the front of this edition, under the heading "Climate and Meteorology", for special material published in previous editions of the Year Book.

### Section 3.—Standard Time and Time Zones

Information regarding the general adoption of standard time zones and the divisions within Canada is given at pp. 72-73 of the 1950 Year Book.

1 Day-degrees represent the difference in temperature between the mean temperature of the air and the temperature of 65°F. multiplied by the number of days during which the outside temperature was lower than that figure, computed for the period Sept. 1 to May 31. Fuel consumption for heating purposes will be proportional to these

---

## PART VII.—ASTROPHYSICS

Major astronomical work is carried on by three Canadian institutions; the Dominion Observatory, Ottawa, Ont., the Dominion Astrophysical Observatory, Victoria, B.C. (operated by the Department of Mines and Technical Surveys), and the David Dunlap Observatory, which is associated with the University of Toronto. Of the two Government institutions the Dominion Observatory at Ottawa has specialized mainly in the astronomy of position in solar physics and in various branches of geophysical work, while the major effort in astrophysics has been concentrated at the Dominion Astrophysical Observatory at Victoria, B.C. The David Dunlap Observatory is a newer institution founded in 1935 with very fine astrophysical equipment of a kind similar to that in use at Victoria. It not only performs the function of a privately financed and administrated research institution but is also the nucleus of a university department of astronomy. A special article dealing specifically with the work of the Dominion Astrophysical Observatory at Victoria, B.C., appears at pp. 63-71 of the 1948-49 edition of the Year Book.

# CHAPTER II.—HISTORY AND CHRONOLOGY

## CONSPECTUS

	PAGE		PAGE
SECTION 1. HISTORY.....	46	SECTION 2. CHRONOLOGY.....	46

### Section 1.—History

For material published in previous editions of the Year Book on Outlines of Canadian History, Bibliography of Canadian History, and Historical Records, see list at front of this edition.

### Section 2.—Chronology

NOTE.—*The Prime Ministers, dates of elections and lengths of sessions of Federal Parliaments are given in Tables 2 and 5, respectively, of Chapter III. Changes in Provincial Legislatures and Ministries from Confederation to 1923 are given at pp. 75-84 of the 1924 Year Book, from 1924 to 1937 at pp. 110-118 of the 1938 Year Book and from 1938-49 at pp. 86-98 of this edition. References to these matters are, therefore, not included in the Chronology.*

1497. June 24, Eastern coast of North America discovered by John Cabot in the service of King Henry VII of England.
1498. Cabot discovered Hudson Strait.
1501. Gaspar Corte-Real visited Newfoundland and Labrador on behalf of Portugal.
1524. Verrazano explored the coasts of Nova Scotia and Newfoundland. French claims to Newfoundland were based on his exploration.
1534. July 24, Jacques Cartier, on his first voyage, erected a cross at Gaspé, claiming the land for the King of France.
1535. Cartier, on his second voyage, explored the St. Lawrence to Stadacona (Quebec) (Sept. 14), and Hochelaga (Montreal) (Oct. 2).
1541. Cartier's third voyage. He planted wheat, cabbages, turnips, and lettuces near Cap Rouge River.
- 1542-43. De Roberval and his party wintered at Cap Rouge, and were rescued by Cartier on his fourth voyage.

1623. First British settlement in Nova Scotia.
1627. New France and Acadia granted to the Company of One Hundred Associates.
1628. Port Royal taken by Sir David Kirke.
1629. Apr. 24, Treaty of Susa between France and England. July 20, Quebec taken by Sir David Kirke.
1632. Mar. 29, Canada and Acadia restored to France by the Treaty of St. Germain-en-Laye.
1633. May 23, Champlain made first Governor of New France.
1634. July 4, Founding of Three Rivers.
- 1634-35. Exploration of the Great Lakes by Nicolet.
1635. Dec. 25, Death of Champlain at Quebec. Founding of the first college at Quebec.
1640. Discovery of Lake Erie by Chaumonot and Brébeuf.
1641. Resident population of New France, 240.
1642. May 17, Founding of Ville-Marie (Montreal) by Maisonneuve.
1646. Exploration of the Saguenay by Dablon.
1647. July 16, Lake St. John discovered by de Quen.
1648. Mar. 5, Council of New France created.
1654. August, Acadia taken by an expedition from New England. Population of Newfoundland estimated at 1,750.
1655. Nov. 3, Acadia restored to France by Treaty of Westminster.
1656. Acadia granted by Cromwell to La Tour, Temple, and Crowne.
1662. The French landed soldiers and settlers and founded a colony and fortified harbour at Placentia, Newfoundland.
1663. Company of One Hundred Associates dissolved. April, Sovereign Council of New France established.
1665. Mar. 23, Talon appointed Intendant.
1666. Feb. - Mar. First Census: population of New France, 3,215.
1667. July 21, Acadia restored to France by the Treaty of Breda.
1668. Mission at Sault Ste. Marie founded by Marquette.

1670. May 2, Charter of the Hudson's Bay Company granted.
1671. Population of Acadia, 392.
1672. Apr. 6, Comte de Frontenac appointed Governor.
1673. June 13, Cataragui (Kingston) founded.
1678. Niagara Falls visited by Hennepin.
1679. Ship *Le Griffon* built on the Niagara River by La Salle. First vessel to sail the Great Lakes.
1680. Population of Newfoundland, 2,181.
1681. Population of New France, 9,677.
1682. Frontenac recalled. De la Barre appointed Governor.
1685. First issue of card money.
1687. Mar. 18, La Salle assassinated.
1689. June 7, Frontenac reappointed Governor.
1690. May 21, Sir William Phips captured Port Royal but was repulsed in an attack on Quebec (Oct. 16-21).
1692. Population of New France, 12,431. The French captured and burned St. John's, Newfoundland. Oct. 22, Defence of Verchères against Indians by Madeleine de Verchères.
1693. Population of Acadia, 1,018.
1697. Sept. 20, By the Treaty of Ryswick, places taken during the war were mutually restored. D'Iberville defeated the Hudson's Bay Company's ships on Hudson Bay.
1698. Nov. 28, Death of Frontenac.
1701. Population of Acadia (north part of peninsula), 1,134. Newfoundland, British population, 3,575.
1702. Newfoundland French population, 466.
1703. June 16, Sovereign Council of New France became Superior Council.
1708. St. John's, Newfoundland, captured and razed a second time by the French.
1709. British invasion of Canada.
1710. Oct. 13, Port Royal taken by Nicholson.
1713. Apr. 11, Treaty of Utrecht; French rights in Hudson's Bay Company Territories, Acadia, and Newfoundland (except for important fishing rights) relinquished to Great Britain. August, Louisbourg founded by the French. Population of New France, 18,469. British population of Newfoundland, 4,049.
1720. Apr. 25, Governor and Council of Nova Scotia appointed.
1721. June 19, Burning of about one-half of Montreal. Census population of New France, 25,923.
1728. Capt. Henry Osborne appointed first governor of Newfoundland.
1730. Population of New France, 34,753.
1733. Discovery of Lake Winnipeg by La Vérendrye.
1734. Road opened from Quebec to Montreal.
1737. Iron smelted on banks of St. Maurice.
1743. Jan. 1, The younger La Vérendrye discovered the Rocky Mountains.
1745. June 17, Louisbourg taken by Pepperell and Warren.
1748. Oct. 18, Treaty of Aix-la-Chapelle. Louisbourg restored to France in exchange for Madras, India.
1749. June 21, Founding of Halifax — British immigrants (2,544 persons) brought to Nova Scotia by Governor Cornwallis. Fort Rouillé (Toronto) built.
1750. British population of Newfoundland, 6,900.
1752. Mar. 25, Issue of the Halifax *Gazette*, first newspaper in Canada.
1754. Census population of New France, 55,009.
1755. First post office established at Halifax and direct mail communication with Great Britain. June 16, Surrender of Fort Beauséjour on the Isthmus of Chignecto to the British. Sept. 10, Expulsion of the Acadians from Nova Scotia.
1756. Seven Years' War between Great Britain and France began.

Rush-Bagot Convention with the United States, limiting naval armament on the Great Lakes, signed. First resident governor of Newfoundland appointed.
1818. Oct. 20, Convention at London regulating North American fisheries.
- 1819-22. Franklin's overland Arctic expedition.
1820. Oct. 16, Cape Breton re-annexed to Nova Scotia.
1821. Mar. 26, The Northwest Company absorbed by the Hudson's Bay Company.
1822. W. E. Cormack's journey overland across Newfoundland.
1824. Population of Upper Canada, 150,066; of New Brunswick, 74,176.
1825. Opening of the Lachine Canal. Population of Lower Canada, 479,288; Newfoundland, 55,719.
1826. Founding of Bytown (Ottawa).
1827. Sept. 29, Convention of London relating to the territory west of the Rocky Mountains. Population of Nova Scotia (not including Cape Breton), 123,630.
1829. Nov. 27, First Welland Canal opened.
1831. June 1, The North Magnetic Pole discovered by (Sir) James Ross. Population — Upper Canada, 236,702; Lower Canada, 553,134; Assiniboia, 2,390.
1832. Representative government granted to Newfoundland. May 30, Opening of the Rideau Canal.
1833. Jan. 1, A Representative Assembly established for Newfoundland. Aug. 18, The steamer *Royal William*, built at Quebec, crossed the Atlantic from Pictou, N.S., to England.
1834. Feb. 21, The Ninety-Two Resolutions on public grievances passed by the Assembly of Lower Canada.
1836. July 21, Opening of the first railway in Canada from Laprairie to St. Jean, Que. First bank opened in Newfoundland — the Bank of British North America. Population of Newfoundland, 73,705.
1837. Report of the Canada Commissioners. Rebellion in Lower Canada (Papineau) and Upper Canada (W. L. Mackenzie). Nov. 23, Gas lighting first used in Montreal.
1838. Feb. 10, Constitution of Lower Canada suspended and Special Council created. Mar. 30, The Earl of Durham, Governor-in-Chief. Apr. 27, Martial law revoked. June 28, Amnesty to political prisoners proclaimed. Nov. 1, Lord Durham, censured by British Parliament, resigned. Population — Upper Canada, 399,422; Assiniboia, 3,966; Nova Scotia, 202,575.
1839. Feb. 11, Lord Durham's report submitted to Parliament. Oct. 19, Charles Poulett Thomson (Lord Sydenham) arrived in Canada as Governor-in-Chief.
1840. July 23, Passing of the Act of Union. First ship of the Cunard Line arrived at Halifax.
1841. Feb. 10, Union of the two provinces of Upper and Lower Canada as the Province of Canada, with Kingston as capital. Feb. 13, Draper-Ogden Administration. June 13, Meeting of the first united Parliament of Canada. Sept. 19, Death of Lord Sydenham. Population — Upper Canada, 455,688; Prince Edward Island, 47,042.
1842. Aug. 9, The Ashburton Treaty. Sept. 16, Baldwin-Lafontaine Administration.
1843. June 4, Victoria, B.C., founded. Dec. 12, Draper-Viger Administration.
1844. May 10, Seat of government moved from Kingston to Montreal. Population of Lower Canada, 697,084.
1845. May 28 and June 28, Great fires at Quebec. Franklin started on his last Arctic expedition. Population of Newfoundland, 96,295.

1846. Three-fourths of St. John's, Newfoundland, destroyed by fire. June 15, Oregon Boundary Treaty. June 18, Draper-Papineau Administration. First telegraph, operated by Toronto, Hamilton and Niagara Electro-Magnetic Telegraph Company, opened.
1847. May 29, Sherwood - Papineau Administration. Nov. 25, Montreal - Lachine Railway opened.
1848. Mar. 11, Lafontaine - Baldwin Administration. St. Lawrence canals opened to navigation.
1849. Apr. 25, Signing of the Rebellion Losses Act; rioting in Montreal and burning of the Parliament Buildings. Nov. 14, Toronto made the capital. Vancouver Island granted to the Hudson's Bay Company. Population of Assiniboia, 5,391.
1851. Apr. 6, Transfer of the postal system from the British to the Colonial Government of Canada; uniform rate of postage introduced. Apr. 23, Postage stamps issued. Sept. 22, Quebec became the capital of Canada. Oct. 28, Hincks - Morin Administration. Responsible government granted to Prince Edward Island. Population - Upper Canada, 952,004; Lower Canada, 890,261; New Brunswick, 193,800; Nova Scotia, 276,854.
1852. July 8, Great fire at Montreal.
1853. Opening of Grand Trunk Railway from Montreal to Portland.
1854. June 5, Reciprocity Treaty with the United States. Sept. 11, MacNab-Morin Administration. Seigneurial tenure in Lower Canada abolished. Secularization of the clergy reserves.
1855. Responsible government established in Newfoundland. Jan. 27, MacNab-Taché Administration. Mar. 9, Opening of the Niagara Railway suspension bridge. Oct. 20, Government moved to Toronto.
1856. The Legislative Council of Canada made elective. First meeting of the Legislature of Vancouver Island. Apr. 17, Quebec made the seat of government. May 24, Taché-J. A. Macdonald Administration. Oct. 27, Opening of the Grand Trunk Railway from Montreal to Toronto. Population of Assiniboia, 6,691.
1857. Nov. 26, J. A. Macdonald - Cartier Administration. Dec. 31, Ottawa chosen by Queen Victoria as future capital of Canada.
1858. February, Discovery of gold in Fraser River Valley, B.C. July 1, Introduction of Canadian decimal currency. Aug. 2, Brown-Dorion Administration. Aug. 5, Completion of the Atlantic cable; Aug. 6, Cartier - J. A. Macdonald Administration. Aug. 20, Colony of British Columbia established. Control of Vancouver Island surrendered by the Hudson's Bay Company.
1859. January, Canadian silver coinage issued.
1860. Sept. 1, Laying of the corner-stone of the Parliament Buildings at Ottawa by Edward, Prince of Wales.
1861. Aug. 14, Great flood at Montreal. Population - Upper Canada, 1,396,091; Lower Canada, 1,111,586; New Brunswick, 252,047; Nova Scotia, 330,857; Prince Edward Island, 80,857.
- 1862-63. May 24, Sandfield Macdonald-Scotte Administration. May 16, Sandfield Macdonald - Dorion Administration.
1864. Mar. 30, Taché - J. A. Macdonald Administration. Conferences on confederation of British North America: Sept. 1, at Charlottetown; Oct. 10-29, at Quebec. Oct. 19, Raid of American Confederates from Canada on St. Albans, Vermont.
1865. Feb. 3, The Canadian Legislature resolved on an address to the Queen praying for union of the provinces of British North America. Aug. 7, Belleau - J. A. Macdonald Administration. Oct. 20, Proclamation fixing the seat of government at Ottawa.
1866. Mar. 17, Termination of the Reciprocity Treaty by the United States. May 31, Fenians from the United States, defeated at Ridgeway (June 2), retreated across the border (June 3). June 8, First meeting at Ottawa of the Canadian Legislature. Nov. 19, Proclamation of the union of Vancouver Island with British Columbia.
1867. Mar. 29, Royal Assent given to the British North America Act. July 1, The Act came into force; Union of the Province of Canada, Nova Scotia and New Brunswick as the Dominion of Canada; Upper and Lower Canada made separate provinces named Ontario and Quebec; Viscount Monck, first Governor General; Sir John A. Macdonald, Prime Minister. Nov. 6, Meeting of the first Dominion Parliament.
1868. July 31, The Rupert's Land Act authorizing the acquisition by the Dominion of the Northwest Territories.
1869. First negotiations for union of Newfoundland with Canada end in failure. June 22, Act providing for the government of the Northwest Territories. Nov. 19, Deed of surrender to the Crown of the Hudson's Bay Company's territorial rights in the Northwest. Outbreak of the Red River Rebellion under Riel.
1870. May 12, Act to establish the Province of Manitoba. July 15, Northwest Territories transferred to the Dominion and Manitoba admitted into Confederation. Aug. 24, End of Red River Rebellion.
1871. Apr. 2, First Dominion Census: population 3,689,257. Apr. 14, Act establishing uniform currency in Canada. May 8, Treaty of Washington signed. July 20, British Columbia entered Confederation. The Dominion undertook to begin construction of a transcontinental railway within two years and to complete it within ten years.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume. Appointments made after this Chapter went to press are given in the Annual Register at the end of this volume.

The government of Canada is provided for by the British North America Act (30-31 Vict., c. 3) of 1867.\* This Statute of the United Kingdom Parliament, as from time to time amended, forms the written basis of the constitution of Canada. Subsequent sections of this Chapter describe the institutions, as at present constituted, by which Canada is governed.

The several stages in the development of the status of Canada have been authoritatively described in the reports of successive Imperial Conferences including that held at London in 1926, which defined the group of self-governing communities consisting of the United Kingdom and the Dominions as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations". That Conference also recognized that, as a consequence of this equality of status, the Governor General of a Dominion "is the representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the Dominion as is held by His Majesty the King in Great Britain", and that "it is the right of the Government of each Dominion to advise the Crown in all matters relating to its own affairs". Simultaneously, with this change in the constitutional relationship between the several parts of the British Commonwealth of Nations, there developed, as a complementary aspect of nationhood, the assumption by the several Dominions of further responsibilities and rights of sovereign States in their relations with other members of the community of

\* See pp. 40-60 of the 1942 Year Book for text of the original B.N.A. Act and notes regarding amendments and modifications thereto.

nations. Membership in the League of Nations and, more recently in the United Nations, the exercise of treaty-making powers and the establishment of separate diplomatic representation in a number of foreign countries have characterized this phase in the growth of Canada. More explicit recognition of the implications of the principles of equality of status was accorded in the Statute of Westminster of 1931, which provided for the removal of the remaining limitations on the legislative autonomy of the Commonwealth nations.

Thus Canada under the Crown, has equality of status with Great Britain and the other Commonwealth nations in both domestic and foreign affairs; its government advises the Crown in the person of the Governor General on all matters relating to Canada. Canada has membership in the United Nations; makes its own treaties; appoints its own ambassadors and other representatives abroad; levies its own taxes; makes its own laws which are executed by a government dependent on the will of a majority of the people; and maintains its own military, naval and air forces. In short, Canada has achieved the full status of democratic nationhood within the Commonwealth of Nations.

## **PART I.—THE CONSTITUTION AND GENERAL GOVERNMENT OF CANADA**

The two basic characteristics of the Canadian constitution are that it is federal and that, apart from the federal aspect, it is modelled closely on the British Parliamentary system.

Federation occurred in 1867 with the union of three colonies, Nova Scotia, New Brunswick, and Canada, which was divided into two provinces, Ontario and Quebec. The colony of British Columbia joined in 1871 and Prince Edward Island in 1873. Three other provinces were created out of Hudson's Bay Company lands acquired in 1868: Manitoba in 1870, and Saskatchewan and Alberta in 1905. Newfoundland, by a majority vote in a national referendum taken on July 22, 1948, decided to enter Confederation and union as a province of Canada took place on Mar. 31, 1949.

The federal aspect of the constitution is defined by the British North America Act, 1867, and amendments. This Act divides the field of legislative and executive power between national and provincial authorities. It provides also the legal framework for national and provincial political institutions, but leaves the provinces full discretion to amend their own constitutions, except with respect to the office of Lieutenant-Governor who is appointed by the Governor General in Council and is the formal head of provincial government, and except that no provincial legislative authority may invade the field allotted by the Act to the Parliament of Canada.

### **Section 1.—The Evolution of the Constitution prior to Confederation**

The process of the development of free government in the Dominion of Canada prior to Confederation is given in an article appearing at pp. 34-40 of the 1942 Year Book. In an Appendix to that article, pp. 40-60, the text of the British North America Act is presented.

## Section 2.—The Development of the Constitution since Confederation

An article bringing the developments since Confederation up to 1943 is published at pp. 41-47 of the 1943-44 Year Book. See also list of Special Articles under "Constitution and Government" at the beginning of this volume.

## Section 3.—The Terms of Union of Newfoundland with Canada, 1949\*

An article on the Constitutional Development of Newfoundland prior to Union with Canada appeared at pp. 85-92 of the 1950 Year Book.

In 1948, two national referenda were held in Newfoundland to decide the future form of government. At the second ballot, held on July 22, Confederation with Canada received 78,323 votes and the restoration of responsible government 71,334 votes. Eighteen of the 25 electoral districts as established in 1933 showed a clear majority for Confederation. On July 30, the Prime Minister of Canada announced that the result of the referendum was "clear and beyond possibility of misunderstanding". He said that the Government of Canada would be "glad to receive with the least possible delay authorized representatives of Newfoundland" to negotiate Terms of Union.

Negotiations opened at Ottawa on Oct. 6, 1948, and the Terms of Union were signed on Dec. 11, 1948. An Act to approve the Terms was passed by the Parliament of Canada on Feb. 18, 1949 (13 Geo. VI., c. 1). The Commission of Government of Newfoundland announced its approval on Feb. 21 and shortly afterwards a Bill to confirm and give effect to the Terms of Union was introduced in the British House of Commons and became law on Mar. 23 as the British North America Act, 1949. In accordance with the Terms, Newfoundland joined Canada as its tenth province at midnight on Mar. 31, 1949.

Under the Terms of Union, the Province of Newfoundland comprises the same territory as at the date of union with Canada and includes the Island of Newfoundland and islands adjacent thereto, and the Coast of Labrador as delimited by the Judicial Committee of the Imperial Privy Council in March, 1927.

The British North America Acts, 1867 to 1946, except for such provisions as affect only one or more and not all the provinces, and the Statute of Westminster, 1931, apply to the Province of Newfoundland in the same way as they apply to the other provinces of Canada.

**Representation in Parliament.**—The Province is entitled to be represented by six members in the Senate and seven members in the House of Commons with readjustment from time to time (see p. 66, *re* distribution) in accordance with the British North America Acts and amendments.

For the constitution of the Provincial Government of Newfoundland after Union see pp. 83 to 84.

**Financial Terms.**—Under the Terms of Union, Canada assumes and provides for the servicing and retirement of stock issued on the security of Newfoundland under the Loan's Act, 1933, and takes over the sinking fund established under that

\*Prepared under the direction of A. D. P. Heeney, Under-Secretary of State, Department of External Affairs.

Act. The sterling debt to be assumed in this manner is about \$63,000,000 net. Newfoundland is to retain its financial surplus accumulated during the War and post-war years, subject to certain conditions.

A fixed annual subsidy of \$180,000 and an adjustable annual subsidy of 80 cents per head of population of the Province (see Public Finance Chapter XXIV) is to be paid by the Federal Government for the local purposes of the Province and the support of its government and legislature, with the proviso that in no year shall the sums payable be less than those payable in the first year after the date of union. An additional subsidy of \$1,100,000, payable for the same purposes as the various fixed annual allowances and subsidies paid from time to time to the Maritime Provinces, is to be paid to the Province of Newfoundland in recognition of its special problems by reason of geography and the sparse and scattered population.

In order to facilitate the adjustment of Newfoundland to the status of a Province of Canada and the development of revenue-producing services, transitional grants are to be paid for 12 years, after the date of union, to the total amount of \$42,750,000. For each of the first three years the transitional grant is to be \$6,500,000. It will, thereafter, be reduced each year so that in the twelfth and final year it will be \$350,000. A Royal Commission is to be appointed by the Government of Canada within eight years from the date of union to review the financial position of the Province and to recommend the form and scale of additional financial assistance if necessary.

**Tax Agreements.**—The Government of Canada after the date of union will make an offer to the Province to enter into a tax agreement for the rental of the taxation fields for personal income, corporation income, corporation taxes and succession duties. The offer will be generally similar to that made to the other provinces (see Public Finance Chapter XXIV). An agreement to this offer as applying to Newfoundland would expire at the end of the fiscal year, Mar. 31, 1952, or at the end of the fiscal year, Mar. 31, 1957, at the option of the Government of Newfoundland. If the Government of the Province accepts the latter option the agreement will provide that the subsequent entry into a tax agreement by the Government of Canada with any other province will not entitle the Government of Newfoundland to any alteration in the terms of its agreement.

**Welfare Services.**—The welfare and other public services provided from time to time by Canada for the people generally are, by the Terms of Union, to be extended to Newfoundland on the same basis and subject to the same terms and conditions as in the case of the other provinces. These include unemployment insurance, family allowances, veterans' benefits, merchant seamen's benefits, assistance for housing and, subject to Newfoundland entering into the necessary agreements or making the necessary contributions, financial assistance under the Physical Fitness Act, health grants, and contributions under the Old Age Pensions Act for old age pensions and pensions for the blind.

**Miscellaneous Provisions.**—Public services and works including the Newfoundland railway, steamship and other marine services; postal and telecommunication services; civil aviation; customs and excise; defence; certain technical surveys; protection and encouragement of fisheries; public radio-broadcasting system; and other public services of a nature similar to these provided at the date of union for the people of Canada generally, are to be taken over by the Federal Government, and the Province of Newfoundland is to be relieved of the public costs incurred for these services.

## PART II.—ORGANIZATION

The Federal Government consists of the King (represented by the Governor General) with the Privy Council (of which the Cabinet, or Ministry, is an active committee responsible to the Legislature for all matters of policy) as the Executive Branch; the Houses of Parliament as the Legislative Branch; and the courts as the Judicial Branch. There is no clearly defined separation of powers since those members of the Privy Council who are members of the Cabinet have seats in the Legislature and, within that body, in turn, the Senate exercises some judicial functions. Each of the provinces has a similar system. In both Federal and Provincial Governments there is responsible government, whereby the Ministry is answerable for its conduct to the elected representatives of the people in the House of Commons or the Legislative Assemblies. This device is not mentioned in the British North America Act but, except for some modifications to meet local conditions, British practice has been followed. Under the constitution the courts administer the law as it is drawn up and amended by the Legislature.

### Section 1.—The Federal Government

#### Subsection 1.—The Executive

**The Governor General.**—The Governor General is appointed by the King (after consultation with the Canadian Government) usually for a term of five years. He is bound by the terms of his commission and instructions and can exercise only such authority as is expressly entrusted to him. He acts under the advice of his Ministry, which is responsible to Parliament, and, as the acting head of the Executive, summons, prorogues and dissolves Parliament and assents to or reserves bills. New Letters Patent came into force on Oct. 1, 1947, whereby it is legally possible for the Governor General, on the advice of Canadian Ministers, to exercise any of the powers and authorities of the Crown in respect of Canada, without the necessity of a submission being made to the King.

**Salary and Allowances.**—The Governor General receives a salary of £10,000 per annum charged against the consolidated revenue of Canada. He also receives a travelling allowance of \$50,000 annually.

#### 1.—Governors General of Canada, Since Confederation

Name	Date of Appointment	Date of Assumption of Office
VISCOUNT MONCK, G.C.M.G.	June 1, 1867	July 1, 1867
LORD LISGAR, G.C.M.G.	Dec. 29, 1868	Feb. 2, 1869
The EARL OF DUFFERIN, K.P., K.C.B., G.C.M.G.	May 22, 1872	June 25, 1872
The MARQUIS OF LORNE, K.T., G.C.M.G.	Oct. 5, 1878	Nov. 25, 1878
The MARQUIS OF LANSDOWNE, G.C.M.G.	Aug. 18, 1883	Oct. 23, 1883
LORD STANLEY OF PRESTON, G.C.B.	May 1, 1888	June 11, 1888
The EARL OF ABERDEEN, K.T., G.C.M.G.	May 22, 1893	Sept. 18, 1893
The EARL OF MINTO, G.C.M.G.	July 30, 1898	Nov. 12, 1898
EARL GREY, G.C.M.G.	Sept. 26, 1904	Dec. 10, 1904
FIELD MARSHAL H.R.H. THE DUKE OF CONNAUGHT, K.G.	Mar. 21, 1911	Oct. 13, 1911
The DUKE OF DEVONSHIRE, K.G., G.C.M.G., G.C.V.O.	Aug. 19, 1916	Nov. 11, 1916
GENERAL THE LORD BYNG OF VIMY, G.C.B., G.C.M.G., M.V.O.	Aug. 2, 1921	Aug. 11, 1921
VISCOUNT WILLINGDON OF RATTON, G.C.S.I., G.C.I.E., G.B.E.	Aug. 5, 1926	Oct. 2, 1926
The EARL OF BESSBOROUGH, G.C.M.G.	Feb. 9, 1931	Apr. 4, 1931
LORD TWEEDSMUIR OF ELSFIELD, G.C.M.G., G.C.V.O., C.H.	Aug. 10, 1935	Nov. 2, 1935
MAJOR-GENERAL THE EARL OF ATHLONE, K.G., P.C., G.C.B., G.C.M.G., G.C.V.O., D.S.O.	Apr. 3, 1940	June 21, 1940
FIELD MARSHAL VISCOUNT ALEXANDER OF TUNIS, K.G., G.C.B., G.C.M.G., C.S.I., D.S.O., M.C., LL.D., A.D.C.	Aug. 1, 1945	Apr. 12, 1946

**The Ministry.**—Canada's system of government is based upon that of the British, by which a Cabinet or Ministry (composed of members of the House of Commons or the Senate) is responsible to Parliament. The Cabinet is actually a committee of the King's Privy Council for Canada. Without enlarging upon the features of the system, it may be sufficient to note that the Cabinet is responsible to the House of Commons and, following established precedent, resigns office when it becomes evident that it no longer holds the confidence of the representatives of the people. Members of the Cabinet are chosen by the Prime Minister; each generally assumes charge of one of the various Departments of Government, although a Minister may hold more than one portfolio at the same time, or may be without portfolio.

## 2.—Prime Ministers Since Confederation

Ministry	Prime Minister	Length of Administration
1	Rt. Hon. Sir JOHN ALEXANDER MACDONALD.....	July 1, 1867 - Nov. 5, 1873
2	Hon. ALEXANDER MACKENZIE.....	Nov. 7, 1873 - Oct. 16, 1878
3	Rt. Hon. Sir JOHN ALEXANDER MACDONALD.....	Oct. 17, 1878 - June 6, 1891
4	Hon. Sir JOHN JOSEPH CALDWELL ABBOTT.....	June 16, 1891 - Nov. 24, 1892
5	Rt. Hon. Sir JOHN SPARROW DAVID THOMPSON.....	Dec. 5, 1892 - Dec. 12, 1894
6	Hon. Sir MACKENZIE BOWELL.....	Dec. 21, 1894 - Apr. 27, 1896
7	Hon. Sir CHARLES TUPPER.....	May 1, 1896 - July 8, 1896
8	Rt. Hon. Sir WILFRID LAURIER.....	July 11, 1896 - Oct. 6, 1911
9	Rt. Hon. Sir ROBERT LAIRD BORDEN.....	Oct. 10, 1911 - Oct. 12, 1917 (Conservative Administration)
10	Rt. Hon. Sir ROBERT LAIRD BORDEN.....	Oct. 12, 1917 - July 10, 1920 (Unionist Administration)
11	Rt. Hon. ARTHUR MEIGHEN.....	July 10, 1920 - Dec. 29, 1921 (Unionist—"National Liberal and Conservative Party")
12	Rt. Hon. WILLIAM LYON MACKENZIE KING.....	Dec. 29, 1921 - June 28, 1926
13	Rt. Hon. ARTHUR MEIGHEN.....	June 29, 1926 - Sept. 25, 1926
14	Rt. Hon. WILLIAM LYON MACKENZIE KING.....	Sept. 25, 1926 - Aug. 6, 1930
15	Rt. Hon. RICHARD BEDFORD BENNETT.....	Aug. 7, 1930 - Oct. 23, 1935
16	Rt. Hon. WILLIAM LYON MACKENZIE KING.....	Oct. 23, 1935 - Nov. 15, 1948
17	Rt. Hon. LOUIS STEPHEN ST. LAURENT.....	Nov. 15, 1948 - ...

## 3.—Members of the Seventeenth Ministry as at Aug. 31, 1950

(According to precedence of Ministers)

NOTE.—A complete list of the members of Federal Ministries from Confederation to 1913 appears in the 1912 Year Book, pp. 422-429. Later Ministries will be found in subsequent editions of the Year Book. Parliamentary Assistants to the Cabinet Ministers are given in footnotes to Table 9.

Office	Occupant	Date of Appointment <sup>1</sup>
Prime Minister and President of the King's Privy Council for Canada.....	Rt. Hon. LOUIS STEPHEN ST. LAURENT.....	{Dec. 10, 1941 Nov. 15, 1948
Minister of Trade and Commerce.....	Rt. Hon. CLARENCE DECATUR HOWE.....	{Oct. 23, 1935 Jan. 19, 1948
Minister of Agriculture.....	Rt. Hon. JAMES GARFIELD GARDINER.....	Oct. 28, 1935
Member of the Administration and Minister without Portfolio.....	Hon. JAMES ANGUS MACKINNON.....	{Jan. 23, 1939 Apr. 1, 1949
Minister of Public Works.....	Hon. ALPHONSE FOURNIER.....	Oct. 6, 1942

For footnote, see end of table, p. 60.

## 3.—Members of the Seventeenth Ministry as at Aug. 31, 1950—concluded

Office	Occupant	Date of Appointment <sup>1</sup>
Minister of National Defence.....	HON. BROOKE CLAXTON.....	{Oct. 13, 1944 Dec. 12, 1946

<sup>1</sup> The ordinary legal limit of duration for each Parliament is five years. <sup>2</sup> Duration of Parliament in years, months and days. The life of a Parliament is counted from the date of return of election writs to the date of dissolution, both days inclusive (B.N.A. Act, Sect. 50). <sup>3</sup> Date of general election. <sup>4</sup> Writs returnable. <sup>5</sup> Dissolution of Parliament. <sup>6</sup> During the war years

Parliament was kept in almost continuous session. When prorogation took place it was followed immediately by a new session. During long adjournments provision was made whereby the Speaker could reconvene Parliament before the date previously set for reassembly.

## Subsection 2.—The Legislature

The Legislative Branch of government, consisting of the Senate and House of Commons, is responsible for the enactment of all legislation. Bills may originate in either the Senate or the House subject to the provisions of Sect. 53 of the British North America Act, 1867, which restricts to the House of Commons the introduction of bills for the appropriation of any part of the public revenue or the imposition of any tax or impost. Bills must pass both Houses and receive the Royal Assent before becoming law. In practice most Public Bills originate in the House of Commons, although there has been a marked increase recently in the introduction of Public Bills in the Senate. For some years past all Private Bills have originated in the Senate.

**The Senate.**—From an original membership of 72 at Confederation, the Senate, through the addition of new provinces and the general growth of population, now has 102 members, the latest change in representation having been made on the admission of Newfoundland to Confederation in 1949. The growth of representation in the Senate is traced at pp. 47-49 of the 1940 edition of the Year Book and is summarized, by provinces, in Table 6. Members of the Senate receive a sessional indemnity of \$4,000. In addition they receive an annual expense allowance of \$2,000 paid at the end of each calendar year.

**The House of Commons.**—In Sect. 37 of the British North America Act of 1867 it was provided that "The House of Commons shall, subject to the provisions of this Act, consist of one hundred and eighty-one members, of whom eighty-two shall be elected for Ontario, sixty-five for Quebec, nineteen for Nova Scotia, and fifteen for New Brunswick". Further, under Sect. 51, it was enacted that, after the completion of the Census of 1871 and of each subsequent decennial census, the representation of the four provinces should be readjusted by such authority, in such manner, and from such time, as the Parliament of Canada provided, subject to and according to certain rules set out in the original Act.

The representation of the provinces in the Federal Parliament as at 1867 and the readjustments that took place with the admission of the newer provinces into Confederation and with each decennial census up to 1931, are outlined at pp. 57-59 of the 1946 Year Book. The number of representatives of each province elected at each of the 21 general elections since Confederation is given in Table 8.

*Redistribution of Parliamentary Constituencies, 1947.*—After the completion of the 1941 Census the redistribution required by the British North America Act following each decennial census was postponed. A resolution to that effect was presented to Parliament and forwarded to London in the form of an Address to His Majesty the King. His Majesty caused a Bill to be laid before the Parliament of the United Kingdom for the enactment of the provisions of the resolution; this was duly passed through all stages by July 22, 1943. The Bill provided that “notwithstanding anything in the British North America Acts, 1867 to 1940, it shall not be necessary that the representation of the provinces in the House of Commons [Canadian] be readjusted, in consequence of the completion of the decennial census taken in the year One Thousand Nine Hundred and Forty-One, until the first session of the Parliament of Canada commencing after the cessation of hostilities between Canada and the German Reich, the Kingdom of Italy and the Empire of Japan”. During the first session of the Twentieth Parliament, the House of Commons and the Senate of Canada petitioned the Imperial Government, requesting an amendment to Section 51 of the British North America Act. As a result, that Section of the Act was repealed and the following substituted therefor:—

- “(1) The number of members of the House of Commons shall be Two hundred and fifty-five and the representation of the provinces therein shall forthwith upon the coming into force of this section and thereafter on the completion of each decennial census be readjusted by such authority, in such manner, and from such time as the Parliament of Canada from time to time provides, subject and according to the following Rules:
- (a) Subject as hereinafter provided, there shall be assigned to each of the provinces a number of members computed by dividing the total population of the provinces by Two hundred and fifty-four and by dividing the population of each province by the quotient so obtained, disregarding, except as hereinafter in this section provided, the remainder if any, after the said process of division.
  - (b) If the total number of members assigned to all the provinces pursuant to Rule One is less than Two hundred and fifty-four, additional members shall be assigned to the provinces (one to a province) having remainders in the computation under Rule One commencing with the province having the largest remainder and continuing with the other provinces in the order of the magnitude of their respective remainders until the total number of members assigned is Two hundred and fifty-four.
  - (c) Notwithstanding anything in this section, if upon completion of a computation under Rules One and Two, the number of members to be assigned to a province is less than the number of senators representing the said province, Rules One and Two shall cease to apply in respect of the said province, and there shall be assigned to the said province a number of members equal to the said number of senators.
  - (d) In the event that Rules One and Two cease to apply in respect of a province then, for the purpose of computing the number of members to be assigned to the provinces in respect of which Rules One and Two continue to apply, the total population of the provinces shall be reduced by the number of the population of the province in respect of which Rules One and Two have ceased to apply and the number Two hundred and fifty-four shall be reduced by the number of members assigned to such province pursuant to Rule Three.
  - (e) Such readjustment shall not take effect until the termination of the then existing parliament.
- “(2) The Yukon Territory as constituted by c. 41 of the Statutes of Canada, 1901, together with any part of Canada not comprised within a province which may from time to time be included therein by the Parliament of Canada for the purposes of representation in parliament, shall be entitled to one member.”

Accordingly, by the Representation Act, 1947 (11 Geo. VI, c. 71) the total membership in the House of Commons was increased from 245 to 255 to be effective at the following general election. The representation of the various provinces is shown in Table 8.

Under the terms of a Bill, assented to on Feb. 18, 1949, and entitled "An Act to approve the Terms of Union of Newfoundland with Canada", provision was made for the Province of Newfoundland to be represented by seven members in the House of Commons. This brought the number of Members of Parliament up to 262.

**The Opposition.**—The Opposition occupies an essential place in constitutions based on the British Parliamentary System. Like many other institutions such as that of the premiership, for instance, it takes its place with the many unwritten arrangements, tested by time, that have been accepted and become firmly established.

The choice of the Canadian electorate not only determines who shall govern Canada but, by deciding which party receives the second largest number of seats in the House of Commons, it settles which of the major parties becomes the Official Opposition. The function of the Leader of the Opposition is to offer intelligent and constructive criticism of the government of the day.

When criticism by the Opposition becomes sufficiently effective it can overthrow the existing government and the Leader of the Opposition might then, as a result of the ensuing election, find himself the Prime Minister.

Although the position of Leader of the Opposition is not recognized in the British North America Act, it received statutory acknowledgment in Canada in 1927. The Senate and House of Commons Act of that year provided for an annual salary to be paid to the Leader of the Opposition in addition to his indemnity as a Member of the House. (See p. 72.)

### 9.—Electoral Districts, Voters on List and Votes Polled, Names and Addresses of Members of the House of Commons, as Elected at the Twenty-First General Election, June 27, 1949.

Speaker.....	The Hon. W. ROSS MACDONALD
Clerk of the House.....	LEON J. RAYMOND
Leader of the Opposition.....	GEORGE A. DREW

NOTE.—This information, except the population of constituencies, has been supplied by the Chief Electoral Officer, Ottawa. Party affiliations are unofficial. The vote is summarized by provinces in Table 11, p. 73. The leaders of the political parties are indicated by asterisks(\*) and Parliamentary Assistants by footnotes.

**Indemnities and Allowances.**—Members of the Senate receive a sessional indemnity of \$4,000. In addition, they receive an annual expense allowance of \$2,000, paid at the end of each calendar year. Members of the House of Commons are paid a sessional indemnity of \$4,000. In addition, they receive \$2,000 as an annual expense allowance, paid at the end of each calendar year. This allowance, except in the case of Ministers of the Crown and the Leader of the Opposition, is not subject to income tax. The remuneration of a Cabinet Minister is \$10,000 a year, the Prime Minister receiving \$15,000, in addition to the sessional indemnity each receives as a Member of Parliament. The Leader of the Opposition also receives \$10,000 a year in addition to his sessional indemnity. Cabinet Ministers are also entitled to a motor-car allowance of \$2,000. The Speakers of the Senate and of the House of Commons receive, besides their sessional indemnity, a salary of \$6,000 and a motor-car allowance of \$1,000 and are also entitled to \$3,000 in lieu of a residence. The Deputy Speaker of the House of Commons receives a salary of \$4,000 and an allowance in lieu of a residence of \$1,500. Parliamentary Assistants to the Ministers of the Crown, of whom there were 9 at Aug. 31, 1950, receive \$4,000 sessional indemnity as Members of Parliament, \$4,000 a year as Parliamentary Assistants and the \$2,000 allowed to all other Members of Parliament.

**The Franchise.**—Legislation concerning the right to vote at federal elections is outlined at pp. 72-73 of the 1947 Year Book.

The present franchise laws are contained in the Dominion Elections Act, 1938 (2 Geo. VI, c. 46, as amended by 6 Geo. VI, c. 26 and 12 Geo. VI, c. 46). The franchise is conferred upon all British subjects, men and women, who have attained the age of 21 years and who have been ordinarily resident in Canada for 12 months prior to polling day at a federal election, and ordinarily resident in the electoral district on the date of the issue of the writ ordering such election. Classes of persons denied the right to vote are:—

- (1) Judges appointed by the Governor General in Council;
- (2) The returning officer for each electoral district;
- (3) Persons undergoing punishment as inmates of any penal institution for the commission of any offence;
- (4) Indians ordinarily resident on an Indian reservation who did not serve in the First or Second World Wars;
- (5) Persons restrained of their liberty or management of their property by reason of mental disease;
- (6) Eskimos, whether born in Canada or elsewhere;
- (7) Doukhobors, residing in the Province of British Columbia, whether born in Canada or elsewhere, excepting those who have served in the naval, military, or air forces [of His Majesty] in any war, and their wives and descendants;
- (8) Persons disqualified under any law relating to the disqualification of electors for corrupt and illegal practices.

The Act to amend the Dominion Elections Act, passed on June 15, 1948, removed the provisions previously in effect which disqualified Japanese or other persons by reason of race from voting at federal elections, also inmates of institutions maintained by any government or municipality for the housing of the poor.

Regulations, known as the Canadian Defence Service Voting Regulations, were drawn up and promulgated in 1948 prescribing voting procedure for personnel of the Permanent Force of the Army, Navy and Air Force. The regulations provide that these voters cast their ballots for candidates in the constituency in which they last resided prior to enlistment.

#### 11.—Voters on the Lists and Votes Polled at the General Elections of 1935, 1940, 1945 and 1949

NOTE.—Corresponding statistics for the general elections of 1911, 1917, 1921 and 1925 will be found at p. 82 of the 1926 Year Book; those for 1926 at p. 66 of the 1945 edition; and those for 1930 at p. 94 of the 1948-49 edition.

### Subsection 3.—The Judiciary

#### The Federal Judiciary

The Parliament of Canada is empowered by Sect. 101 of the British North America Act to provide from time to time for the constitution, maintenance and organization of a general Court of Appeal for Canada and for the establishment of any additional courts for the better administration of the laws of Canada. Under this provision the Parliament of Canada has established the Supreme Court of Canada, the Exchequer Court of Canada and certain miscellaneous courts.

**Supreme Court of Canada.**—This Court, first established in 1875 and now governed by the Supreme Court Act (R.S.C. 1927, c. 35, as amended in 1949), consists of a chief justice, who is called the Chief Justice of Canada, and eight puisne judges. The chief justice and the puisne judges are appointed by the Governor in Council and they hold office during good behaviour but are removable by the Governor General on address of the Senate and House of Commons and they cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and exercises general appellate jurisdiction throughout Canada in civil and criminal cases. The Court is also required to consider and advise upon questions referred to it by the Governor in Council and it may also advise the Senate or House of Commons on Private Bills referred to the Court under any rules or orders of the Senate or House of Commons.

Appeals may be brought from any final judgment of the highest court of final resort in a province in any case where the amount or value of the matter in controversy exceeds the sum of \$2,000. An appeal may be brought from any other final judgment with leave of the highest court of final resort in the province; if such court refuses to grant leave, the Supreme Court of Canada may grant leave to appeal. The Supreme Court may grant leave to appeal from any judgment, whether final or not. Appeals in respect of indictable offences are regulated by Sects. 1023 and 1025 of the Criminal Code. Appeals from federal courts are regulated by the statute establishing such courts.

The judgment of the Supreme Court of Canada in all cases is final and conclusive. Table 12 gives the judges of the Supreme Court of Canada with date of their appointment.

**12.—Chief Justice and Judges of the Supreme Court of Canada as at Aug. 31, 1950**  
(By order of seniority)

Name	Date of Appointment
The Rt. Hon. Chief Justice THIBAudeau RINFRET.....	Jan. 8, 1944
The Hon. Justice PATRICK KERWIN.....	July 20, 1935
The Hon. Justice ROBERT TASCHEREAU.....	Feb. 9, 1940

The Hon. Justice ROY L. KELLOCK.....	Oct. 3, 1944
The Hon. Justice JAS. W. ESTEY.....	Oct. 6, 1944
The Hon. Justice CHARLES H. LOCKE.....	June 3, 1947
The Hon. Justice JOHN R. CARTWRIGHT.....	Dec. 23, 1949
The Hon. Justice GERALD FAUTEUX.....	Dec. 23, 1949

**Exchequer Court.**—The Exchequer Court of Canada was first established in 1875 as part of the Supreme Court of Canada but is now a separate court governed by the Exchequer Court Act (R.S.C. 1927, c. 34). The Court consists of a

president and four puisne judges who are appointed by the Governor in Council. The president and the puisne judges hold office during good behaviour but may be removed by the Governor General on address of the Senate and House of Commons. They cease to hold office upon attaining the age of 75 years. One of the puisne judges is the Chief Commissioner of the Board of Transport Commissioners. The Court sits at Ottawa and also at any other place in Canada for which sittings may be fixed by the Court. The jurisdiction of the Court extends to cases where claims are made by or against the Crown in right of Canada. Proceedings against the Crown are taken by petition of right pursuant to the Petition of Right Act (R.S.C. 1927, c. 158). Before proceedings can be taken against the Crown a fiat must be obtained from the Governor General.

An appeal lies to the Supreme Court of Canada from any final judgment of the Exchequer Court in which the amount in controversy exceeds \$500; an appeal also lies with leave of the Supreme Court in certain cases where the amount in controversy does not exceed \$500 or where the judgment is not final.

The Exchequer Court also exercises admiralty jurisdiction in Canada. Admiralty jurisdiction was first conferred in 1891 by the Admiralty Act (54-55 Vict., c. 29) and the admiralty jurisdiction is now governed by the Admiralty Act (24-25 Geo. V, c. 31). Under this statute the Exchequer Court is continued as a Court of Admiralty. The president and puisne judges of the Exchequer Court exercise admiralty jurisdiction throughout the whole of Canada. In addition, Canada is divided into various admiralty districts; a district judge in admiralty is appointed for each district. Appeals to the Supreme Court of Canada from judgments of the president or the puisne judges are governed by the general appeal provisions in the Exchequer Court Act. Appeals may be taken from a final judgment of a district judge in admiralty either to the Exchequer Court or directly to the Supreme Court of Canada.

**Miscellaneous Courts.**—*Railway Act.*—The Railway Act (R.S.C. 1927, c. 170) established the Board of Railway Commissioners for Canada as a court of record; by the Transport Act, 1938 (2 Geo. VI, c. 53), the name was changed to the Board of Transport Commissioners for Canada. This court exercises jurisdiction with respect to railway matters. The Governor in Council is given jurisdiction to vary any order of the Board and an appeal lies from the Board to the Supreme Court of Canada upon a question of jurisdiction or a question of law.

*Bankruptcy Act.*—By virtue of para. 21 of Sect. 91 of the British North America Act, Parliament has exclusive legislative jurisdiction in relation to bankruptcy and insolvency. By the Bankruptcy Act (13 Geo. VI, c. 7) the superior courts of the provinces are constituted bankruptcy courts; original jurisdiction is conferred upon the trial courts and appellate jurisdiction is conferred upon the appeal courts of the provinces.

*Farmers' Creditors Arrangement Act.*—Under the Farmers' Creditors Arrangement Act, 1943 (7 and 8 Geo. VI, c. 26), the county or district courts of the provinces are established as courts for the purposes of this Act and the appeal courts of the provinces are given appellate jurisdiction.

*Income Tax Appeal Board.*—By the Income Tax Act (11-12 Geo. VI, c. 52) an Appeal Board is established, consisting of a Chairman and not less than two or more than four members, with jurisdiction over appeals against income tax assessments. A further appeal may be taken to the Exchequer Court.

### Provincial Judiciaries\*

Certain provisions of the British North America Act govern, to some extent, the provincial judiciaries. Under Sect. 92 (14) the legislature of each province may exclusively make laws in relation to the administration of justice in the province including the constitution, maintenance and organization of provincial courts, both of civil and criminal jurisdiction. Sect. 96 provides that the Governor General in Council shall appoint the judges of the superior, district and county courts in each province, except those of the courts of probate in Nova Scotia and New Brunswick. Sect. 100 provides that the salaries, allowances and pensions of judges of the superior, district and county courts (except the courts of probate in Nova Scotia and New Brunswick) are to be fixed and provided by the Parliament of Canada, and these are set out in the Judges Act, 1946 (10 Geo. VI, c. 56). Under Sect. 99 the judges of the superior courts hold office during good behaviour, but are removable by the Governor General on address of the Senate and House of Commons. The tenure of office of district and county court judges is fixed by Sect. 33 of the Judges Act, 1946, as being during good behaviour and their residence within the county or union of counties for which the court is established.

**Newfoundland.**—*Supreme Court [Consolidated Statutes (Third Series) c. 83].*—The Supreme Court of Newfoundland consists of a chief justice and two other judges, appointed by the Governor General in Council. The Court has original and appellate jurisdiction.

*District Courts*† [*the District Courts Act, 1949, (the Act No. 96 of 1949, Statutes of Newfoundland)*].—Under the District Courts Act, 1949, district courts were set up. A district court judge has civil jurisdiction where the amount involved does not exceed \$1,000 and on the criminal side he has the same jurisdiction as a county court judge.

*Stipendiary Magistrates and Justices of the Peace [the Summary Jurisdiction Act, 1930, (21 Geo. V, c. 14)].*—Stipendiary magistrates and justices of the peace are appointed for the Province and have limited criminal and civil jurisdiction.

**Prince Edward Island.**—*Supreme Court (S.P.E.I. 1940, c. 35).*—The Supreme Court of Prince Edward Island consists of a chief justice, who is known as the Chief Justice of Prince Edward Island, and two other judges, all appointed by the Governor General in Council. The Court has original and appellate jurisdiction.

*Court of Chancery (S.P.E.I. 1940, c. 11).*—The Court of Chancery consists of a Chancellor, a Vice-Chancellor and the Master of the Rolls. The Chancellor is the Lieutenant-Governor, the Vice-Chancellor is one of the judges of the Supreme Court and the Master of the Rolls is one of the other judges of the Supreme Court. The Court has original jurisdiction in chancery matters.

*County Courts (S.P.E.I. 1937, c. 6).*—There are three counties in the Province with a county court and judge for each county. Each court has criminal jurisdiction and also civil jurisdiction generally in actions up to \$500, but has no jurisdiction in cases involving title to or possession of land.

*Probate Court (S.P.E.I. 1938, c. 41).*—The Probate Court has one judge, appointed by the Lieutenant-Governor in Council. The Court has jurisdiction in probate and guardianship matters.

\* Material revised by the Provincial Departments of the Attorney General.

† The Central District Court was abolished in 1949.

*Magistrates and Justices of the Peace (S.P.E.I. 1939, c. 32).*—Magistrates and justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited criminal and civil jurisdiction.

**Nova Scotia.**—*Supreme Court (S.N.S. 1919, c. 32).*—The Supreme Court of Nova Scotia consists of a chief justice and six other judges appointed by the Governor General in Council. The Court has original and appellate jurisdiction in civil and in criminal cases. Sitting individually the judges act as trial division judges and sitting *en banc* they act as appeal judges.

*Court of Divorce and Matrimonial Causes (R.S.N.S., Third Series, c. 126).*—This Court was established by a pre-Confederation statute and has divorce jurisdiction only. The judges of the Supreme Court are also appointed judges of this Court.

*County Courts (S.N.S. 1945, c. 5).*—There are seven county court districts in Nova Scotia and a county court and judge for each district. The judges are appointed by the Governor General in Council. Each court has criminal jurisdiction and jurisdiction in civil cases up to \$1,000, but no jurisdiction where any devise or bequest is disputed.

*Probate Courts (R.S.N.S. 1923, c. 217).*—By the Probate Act the county court judges are *ex officio* judges in probate. Probate matters are decided in the first instance by a registrar of probate and appeals may be taken to the probate judges. A registrar of probate is appointed for each county.

*Magistrates.*—There are 64 stipendiary magistrates and seven provincial magistrates, all appointed by the Lieutenant-Governor in Council. They have limited criminal jurisdiction and civil jurisdiction up to \$100.

*Minor Courts of Civil Jurisdiction.*—These consist of courts established pursuant to city charters, municipal courts and justices courts. The city and municipal courts have jurisdiction up to \$100 and justices courts have jurisdiction up to \$20 singly or up to \$80 when two justices are sitting.

*Juvenile Courts (R.S.N.S. 1923, c. 166).*—The Children's Protection Act provides for the establishment of juvenile courts and the appointment of juvenile court judges. The courts exercise jurisdiction in juvenile matters under provincial statutes and are also juvenile courts under the Dominion Juvenile Delinquents Act. There are six juvenile court judges.

**New Brunswick.**—*Supreme Court (R.S.N.B. 1927, c. 113).*—The Supreme Court of New Brunswick consists of three divisions, namely, an Appeal Division, a Chancery Division and a King's Bench Division. The Appeal Division consists of a chief justice, who is known as the Chief Justice of New Brunswick, and two other judges. The Chancery Division consists of three judges who are the judges of the Appeal Division. The King's Bench Division consists of a chief justice and three other judges. The Appeal Division has general appellate jurisdiction throughout the Province and the King's Bench Division has unlimited original jurisdiction throughout the Province in civil and criminal matters except in chancery. All judges are appointed by the Governor General in Council.

*Court of Divorce and Matrimonial Causes (R.S.N.B. 1927, c. 115).*—This Court was established by a pre-Confederation statute which has continued in force to date. It has divorce jurisdiction only. There is one judge who is appointed by the Governor General in Council.

*County Courts (R.S.N.B. 1927, c. 116).*—The Province is divided into counties with a county court for each county or group of counties. There are six county court judges, appointed by the Governor General in Council. These courts have criminal jurisdiction, jurisdiction in contracts up to \$400 and jurisdiction in damage actions up to \$200. They have no jurisdiction where title to land is brought in question or the validity of any devise or bequest is disputed.

*Probate Courts (R.S.N.B. 1927, c. 120).*—A Probate Court is established by provincial Act for each county and each such court is presided over by a judge appointed by the Lieutenant-Governor in Council. They have jurisdiction over estates.

*Juvenile Courts (S.N.B. 1944, c. 44).*—The Juvenile Courts Act provides for the establishment of a juvenile court for each place where the federal Juvenile Delinquents Act is in force. Three judges have been appointed, one for Saint John, one for Fredericton and one for the County of Westmorland. These courts have jurisdiction in juvenile matters under provincial statutes and are also juvenile courts under the federal Juvenile Delinquents Act.

*Magistrates.*—There are four classes of magistrates, namely, those appointed under the Local Courts Act (R.S.N.B. 1927, c. 121), the Towns Incorporation Act (R.S.N.B. 1927, c. 179), under city charters and under the Magistrates Act (S.N.B. 1942, c. 58). Magistrates have limited civil and criminal jurisdiction.

*Justices and Commissioners Courts.*—These courts of limited jurisdiction are gradually being replaced by magistrates courts.

**Quebec.**—*Court of King's Bench. (Quebec Courts of Justice Act, R.S.C., 1941, c. 15).*—This Court has two appellate jurisdictions and one original jurisdiction.

Composed of twelve Judges appointed by the Governor General in Council, including a chief justice called the Chief Justice of the Province of Quebec, the Court of King's Bench has:—

Appellate jurisdiction in the civil matters mentioned in Sections 42 and following of the Code of Civil procedure; and

Appellate jurisdiction concerning convictions on indictments. (Sects. 1012 and following of the Criminal Code.)

Presided by a judge of the Superior Court, the Court of King's Bench has:—

Original jurisdiction in criminal matters when the accused is committed to stand a trial on an indictment; and

Appellate jurisdiction in accordance with the provisions of Sects. 749 and following of the Criminal Code relating to the appeal against summary conviction or against the dismissal of a complaint.

*Superior Court.*—The Superior Court is a court of record and is composed of a chief justice, an associate chief justice and 40 puisne judges, all of whom are appointed by the Governor General in Council.

This Court has general original jurisdiction in all suits or actions that are not exclusively within the jurisdiction of the Circuit Court, the Magistrate's Court or the Exchequer Court of Canada and it has exclusive original jurisdiction in cases of petition of right (Sects. 48 and following of the Code of Civil Procedure).

*Magistrate's Courts.*—The Lieutenant-Governor in Council may, by proclamation, establish one or more magistrate's courts in and for each judicial district or electoral district or in and for any place in the Province. These courts are courts of record and, in civil matters, have jurisdiction determined by Sections 61 and following of the Code of Civil Procedure.

To preside over the said courts, the Lieutenant-Governor in Council may appoint 33 magistrates including a Chief District Magistrate and an Associate Chief District Magistrate.

*Family Courts.*—The Act governing family courts (see 1948-49 Year Book, p. 99) has been abolished. On Apr. 21, 1950, social welfare court legislation was published in the *Quebec Official Gazette* but the Act has not yet come into force.

*Court of the Sessions of the Peace.*—This Court is a court of record and is composed of a number of judges, not exceeding 25, including one chief justice with residence at Montreal and one chief justice with residence at Quebec.

These judges are appointed by the Lieutenant-Governor in Council and, besides presiding over the Court of the Sessions of the Peace, they exercise, in criminal and penal matters, such powers as are conferred on them by federal Acts as well as by provincial Acts.

*Recorder's Courts.*—These courts are municipal courts and are established under the authority of by-laws adopted, as the case may be, by the Council of Cities or Towns. The recorders are appointed by the Lieutenant-Governor in Council.

*Commissioners' Courts.*—These courts are established by provincial authority. Their original jurisdiction is limited to the matters mentioned in Sect. 59 of the Code of Civil procedure.

*Justices of the Peace.*—The Justices of the Peace are appointed by the Lieutenant-Governor in Council and, as such, they have the powers conferred upon them by the Criminal Code and other federal laws and also by the Quebec Summary Conviction Act (S.R.Q. 1941, c. 29) and other provincial Acts.

**Ontario.**—*Supreme Court (R.S.O. 1937, c. 100).*—The Supreme Court of Ontario consists of two divisions, one of which is known as the Court of Appeal for Ontario and the other as the High Court of Justice for Ontario. The Court of Appeal consists of a chief justice, who is called the Chief Justice of Ontario, and nine other judges. The High Court of Justice consists of a chief justice, who is known as the Chief Justice of the High Court, and 16 other judges. All judges are appointed by the Governor General in Council. The Court of Appeal has general appellate jurisdiction throughout the Province and the High Court of Justice has unlimited original jurisdiction in civil and criminal matters.

*County and District Courts (R.S.O. 1937, c. 103).*—The Province is divided into 48 counties and districts with a county or district court for each county or district and one or more judges for each court. There are 62 judges in all, and they are appointed by the Governor General in Council. These courts have no criminal jurisdiction except on appeal from the decision of magistrates and justices of the peace in summary conviction cases. They have jurisdiction in contracts where the amount claimed does not exceed \$1,200 and jurisdiction in personal property actions where the amount claimed does not exceed \$1,000.

*General Sessions of the Peace (R.S.O. 1937, c. 104).*—There is a court of general sessions of the peace for each county and district in the Province. In the Counties of York and Wentworth the sittings are held quarterly and in the other counties and districts, semi-annually. The courts are presided over by the Judge of the County Court acting as chairman. They sit with a jury and have jurisdiction to try any indictable offence except those set out in Sect. 583 of the Criminal Code which are within the exclusive jurisdiction of the Superior Courts.

*The County Court Judges Criminal Courts (R.S.O. 1937, c. 105).*—These are criminal courts held in every county and district in the Province for the speedy trial of indictable offences under Part XVIII of the Criminal Code. They are presided over by the county or district court judge sitting without a jury. They have jurisdiction to try, on the election of the accused, any indictable offence except those set out in Sect. 583 of the Criminal Code.

*Surrogate Courts (R.S.O. 1937, c. 106).*—There is a surrogate court for each county or district. The court has jurisdiction to deal with probate and administration matters and is presided over by the county or district court judge.

*Division Courts (R.S.O. 1937, c. 107).*—There are 285 division courts throughout the Province. These are presided over by the county or district court judge who sits in the jurisdiction where the particular division court is located. Jurisdiction is limited to cases up to \$200 except where there is a written contract or a promise in which case jurisdiction extends to \$400.

*Juvenile Courts (R.S.O. 1937, c. 316).*—The juvenile courts for Ontario have jurisdiction in juvenile cases under provincial legislation; in addition they are juvenile courts for the purposes of the federal Juvenile Delinquents Act. The judges are appointed by the Lieutenant-Governor in Council; sometimes the county or district judge is appointed, sometimes the local magistrate and sometimes a person is appointed specially for the purpose of acting as a juvenile court judge.

*Magistrates (R.S.O. 1937, c. 133).*—Magistrates are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction and are ex officio justices of the peace.

*Justices of the Peace (R.S.O. 1937, c. 132).*—Justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction.

**Manitoba.**—*Court of Appeal (R.S.M. 1940, c. 40).*—The Court of Appeal consists of a chief justice, who is called the Chief Justice of Manitoba, and four other judges. All judges are appointed by the Governor General in Council. The Court has general appellate jurisdiction throughout the Province.

*Court of King's Bench (R.S.M. 1940, c. 34).*—The Court consists of a chief justice, who is known as the Chief Justice of the King's Bench, and five other judges. All judges are appointed by the Governor General in Council. The Court has unlimited original jurisdiction throughout the Province in civil and criminal cases.

*County Courts (R.S.M. 1940, c. 42).*—The Province is divided into six judicial districts and a number of county courts are established for each district. A judge is appointed by the Governor General in Council for each district and he is the judge of all the county courts within the district. There are five judges for the Eastern Judicial District and the other districts each have one judge. These courts have criminal jurisdiction and also jurisdiction generally in claims not exceeding \$800 but have no jurisdiction in certain types of actions such as recovery of land.

*Surrogate Courts (R.S.M. 1940, c. 45).*—There is a surrogate court for each judicial district and the Surrogate Courts Act provides that the county court judge in each judicial district is to be the judge of the surrogate court of that district. These courts have jurisdiction and authority in relation to testamentary matters.

*Juvenile Courts (R.S.M. 1940, c. 32).*—The juvenile courts are established under the Child Welfare Act and the territorial jurisdiction of each court is set out in the Order in Council establishing the court and appointing the judges. There are a number of judges appointed in each District one of whom is designated the Senior Judge. The courts have power to deal with cases involving children under the Child Welfare Act and other provincial statutes and are also juvenile courts for the purposes of the Juvenile Delinquents Act.

*Police Magistrates (R.S.M. 1940, c. 125).*—Police magistrates are appointed by the Lieutenant-Governor in Council and in addition to criminal jurisdiction they have jurisdiction to try actions for debt where the amount does not exceed \$100. An appeal lies to a county court judge. There are 36 police magistrates in the Province.

*Justices of the Peace (R.S.M. 1940, c. 125).*—Justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited criminal jurisdiction and also small-debt jurisdiction up to \$100.

**Saskatchewan.**—*Court of Appeal (R.S.S. 1940, c. 60).*—The Court of Appeal consists of a chief justice, who is called the Chief Justice of Saskatchewan, and four other judges. All judges are appointed by the Governor General in Council. The Court has general appellate jurisdiction throughout the Province.

*Court of King's Bench (R.S.S. 1940, c. 61).*—The Court of King's Bench consists of a chief justice, who is called the Chief Justice of the King's Bench, and six other judges. All judges are appointed by the Governor General in Council. The Court has unlimited original jurisdiction throughout the Province in civil and criminal matters.

*District Courts (R.S.S. 1940, c. 62).*—The Province is divided into 21 judicial districts and there is a district court for each judicial district. The judges are appointed by the Governor General in Council. Each court has jurisdiction generally in all cases where the claim does not exceed \$1,200, but jurisdiction does not include cases where title to land is brought in question or where the validity of any devise or bequest is disputed. Jurisdiction is also excluded in certain personal actions such as malicious prosecution, malicious arrest, false imprisonment, libel, slander and breach of promise of marriage. The courts also have criminal jurisdiction.

*Surrogate Courts (R.S.S. 1940, c. 63).*—There is a surrogate court for each judicial district and the Surrogate Courts Act provides that the judge of the district court shall be the judge of the surrogate court. The court has jurisdiction in probate matters.

*Juvenile Courts (S.S. 1946, c. 91).*—Under the Child Welfare Act a Juvenile Court for the Province is established. Each judge of a district court and each police magistrate in the Province is ex officio a judge of this Juvenile Court and, in addition, the Lieutenant-Governor in Council may appoint other judges thereto. A juvenile court has jurisdiction over juvenile offences under provincial statutes and also has jurisdiction under the federal Juvenile Delinquents Act.

*Magistrates' Courts (R.S.S. 1940, c. 94).*—Magistrates are appointed by the Lieutenant-Governor in Council. There are eight full-time and eight part-time magistrates. The magistrates exercise criminal jurisdiction and are ex officio justices of the peace and accordingly have the jurisdiction of a justice of the peace in civil cases.

*Justices of the Peace (R.S.S. 1940, c. 95).*—Justices of the peace are appointed by the Lieutenant-Governor in Council and, in addition to limited criminal jurisdiction, have jurisdiction in civil cases up to \$100.

**Alberta.**—*Supreme Court (R.S.A. 1942, c. 129).*—The Supreme Court of Alberta consists of two branches or divisions; one is designated the Appellate Division of the Supreme Court of Alberta and the other is designated the Trial Division of the Supreme Court of Alberta. The Appellate Division consists of a chief justice, who is called the Chief Justice of Alberta, and four other judges. The Trial Division consists of a chief justice, who is called the Chief Justice of the Trial Division, and five other judges. All judges of the Supreme Court are appointed by the Governor General in Council. The Appellate Division exercises general appellate jurisdiction throughout the Province and the Trial Division has unlimited original jurisdiction in civil and criminal matters.

*District Courts (R.S.A. 1942, c. 121).*—There are two district court districts in Alberta, namely, the District of Northern Alberta and the District of Southern Alberta, with a district court for each. The Court of the District of Northern Alberta consists of a chief judge and five other judges and the Court of the District of Southern Alberta consists of a chief judge and four other judges. All judges are appointed by the Governor General in Council. The district courts generally have jurisdiction in all cases where the claim does not exceed \$600 and in criminal, probate and guardianship matters.

*Juvenile Courts (S.A. 1944, c. 8).*—The Child Welfare Act establishes a Juvenile Court for the Province and every judge of the Supreme Court, every judge of a district court and every police magistrate is ex officio a judge thereof. In addition the Lieutenant-Governor in Council may appoint other persons to be judges of the juvenile courts; 11 such judges have been appointed. A juvenile court has jurisdiction to hear and determine offences charged against children under any statute of the Province and, in addition, is a juvenile court for the purposes of the federal Juvenile Delinquents Act.

*Police Magistrates (R.S.A. 1942, c. 134).*—Police magistrates have criminal jurisdiction and also jurisdiction in actions for debt not exceeding \$100 and wage claims not exceeding six months wages. One-hundred and three police magistrates have been appointed.

*Justices of the Peace (R.S.S. 1942, c. 134).*—Justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction. Two-hundred and sixty-two justices of the peace have been appointed.

**British Columbia.**—*Court of Appeal (R.S.B.C. 1948, c. 74).*—The Court of Appeal consists of a chief justice, who is called the Chief Justice of British Columbia, and four other judges who are called Justices of Appeal. All are appointed by the Governor General in Council. The Court exercises general appellate jurisdiction.

*Supreme Court (R.S.B.C. 1948, c. 73).*—This Court consists of a chief justice, who is called the Chief Justice of the Supreme Court, and seven other judges who are called Judges of the Supreme Court. All are appointed by the Governor General in Council. The Court has unlimited original jurisdiction throughout the Province in civil and criminal matters.

*County Courts (R.S.B.C. 1948, c. 75).*—There are eight counties in the Province with a county court for each county and one or more judges for each county court. All judges are appointed by the Governor General in Council. Each

county court has jurisdiction up to \$1,000 generally and in some cases up to \$2,500 and has jurisdiction in criminal and probate matters. The courts have no jurisdiction in certain types of personal actions such as libel, slander or breach of promise of marriage.

*Small Debts Courts (R.S.B.C. 1948, c. 79).*—The Small Debts Court Act provides that the Lieutenant-Governor in Council may appoint any stipendiary magistrate, police magistrate or any two justices of the peace to exercise small-debt jurisdiction within the territorial limits for which he or they have been appointed. There are 97 small debts court magistrates. Jurisdiction is limited to \$100 and an appeal lies to the nearest county court judge or Supreme Court judge.

*Magistrates and Justices of the Peace (R.S.B.C. 1948, c. 195).*—Magistrates and justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction.

## Section 2.—Provincial Governments

In each of the provinces, the King is represented by a Lieutenant-Governor appointed by the Governor General in Council. The Lieutenant-Governor acts on the advice and with the assistance of his Ministry or Executive Council, which is responsible to the Legislature and resigns office when it ceases to enjoy the confidence of that body. The Legislature of each province, with the exception of Quebec, is now unicameral, consisting of a Legislative Assembly elected by the people. In Quebec there is a Legislative Council as well as a Legislative Assembly.

### 13.—Provinces and Territories of Canada, with Dates of Admission to Confederation, and Legislative Process by which Admission was Effectuated<sup>1</sup>

Province, Territory or District	Date of Admission or Creation	Legislative Process <sup>2</sup>

<sup>2</sup> For further details *re* legislative

The source of the powers of the Provincial Governments of Canada is the British North America Act, 1867 (30-31 Vict., c. 3 and amendments). Under Sect. 92 of the Act, the Legislature of each province may make laws exclusively in relation to the following matters: amendment of the constitution of the province except as regards the Lieutenant-Governor; direct taxation within the province; borrowing of money on the credit of the province; establishment and tenure of provincial offices and appointment and payment of provincial officers; the management and sale of public lands belonging to the province and of the timber and wood thereon; the establishment, maintenance and management of public and reformatory prisons in and for the province; the establishment, maintenance and management of hospitals, asylums, charities and eleemosynary institutions in and for the province, other than marine hospitals; municipal institutions in the province; shop, saloon, tavern, auctioneer and other licences issued for the raising of provincial or municipal revenue; local works and undertakings other than interprovincial or international lines of ships, railways, canals, telegraphs, etc., or works which, though wholly situated within one province, are declared by the Federal Parliament to be for the general advantage either of Canada or of two or more provinces; the incorporation of companies with provincial objects; the solemnization of marriage in the province; property and civil rights in the province; the administration of justice in the province, including the constitution, maintenance and organization of provincial courts both of civil and criminal jurisdiction, and including procedure in civil matters in these courts\*; the imposition of punishment by fine, penalty, or imprisonment for enforcing any law of the province relating to any of the aforesaid subjects; generally all matters of a merely local or private nature in the province.

Further, in and for each province the Legislature may, under Sect. 93, make laws exclusively in relation to education, subject to certain provisions. The purpose of these provisions was to preserve to a religious minority in any province the same privileges and rights in regard to education which it had at the date of Confederation, but the Provincial Legislatures were not debarred from legislating on the subject of separate schools provided they did not thereby prejudicially affect privileges enjoyed before Confederation by such schools in the province. These powers, given to the four original provinces in Confederation, have, with some slight changes, been retained ever since and the more recently admitted provinces have assumed the same rights and responsibilities on their inclusion as units in the federation as were previously enjoyed by the older provinces.

### Subsection 1.—Newfoundland

The Government of Newfoundland consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The Executive Council consists of the Premier, President of the Council and Minister of Economic Development, the Attorney General and the Ministers of Finance, Health, Public Welfare, Fisheries and Co-operatives, Natural Resources, Education, Provincial Affairs, Labour, Public Works, and Supply and one Minister without portfolio.

The Legislative Assembly has 28 members elected for a term of five years.

The Premier and the Cabinet Ministers each receive a salary of \$7,000 per annum plus a sessional indemnity of \$2,500. Each member of the House of Assembly receives a sessional indemnity of \$2,500. An allowance of \$2,000 is made to the Leader of the Opposition.

\* A description of the provincial courts is given at pp. 76-83.

### 14.—Lieutenant-Governors of Newfoundland, 1949-50, Legislature and Premier, 1949, and Present Ministry<sup>1</sup>, as at June 1, 1950

NOTE.—The Lieutenant-Governor of a province is addressed "His Honour", and is also styled "Honourable", throughout his life. Where a knighthood or other honour has been conferred before, during, or after the term of office it is shown. Legislatures and Ministries from Confederation to 1923 are given at pp. 75-84 of the 1924 Year Book, and for 1924-34 at pp. 110-118 of the 1938 Year Book.

<sup>1</sup> First Ministry of Newfoundland as a province of Canada.

### Subsection 2.—Prince Edward Island

The Government of Prince Edward Island consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The Executive Council consists of: the Premier and President of the Council; Minister of Education; Provincial Secretary; Minister of Industry and Natural Resources; the Attorney and Advocate General and Provincial Treasurer; the Minister of Health and Welfare; the Minister of Agriculture; the Minister of Public Works and Highways; and one Minister without portfolio. The Legislative Assembly has 30 members who serve for five years, 15 of whom are elected on a basis of manhood suffrage and the other 15 elected by property holders only.

The salary of the Premier is \$6,000 and the salaries of the Ministers are as follows: Attorney and Advocate General and Provincial Treasurer, \$4,500; Minister of Health and Welfare and Minister of Public Works and Highways, \$4,000 each;

Minister of Agriculture, \$3,500; Minister of Education, Minister of Industry and Natural Resources and Provincial Secretary, \$3,000 each. Each member of the Assembly is paid the sum of \$700 for each session attended by him and an additional amount of \$300, tax free, as indemnity for expenses incurred. The Speaker is paid a further additional sum of \$400 and an additional amount of \$200, tax free, for indemnity incurred and the Leader of the Opposition is paid a further additional sum of \$800 and an additional amount of \$200, tax free, for indemnity incurred by him in relation to his official duties.

## Subsection 3.—Nova Scotia

The Province of Nova Scotia has a Lieutenant-Governor, Executive Council and a House of Assembly. The Ministry or Cabinet, styled the Executive Council, consists of the Premier and President of the Council and Provincial Treasurer; the Attorney General who is also Provincial Secretary; the Minister of Mines who is also Minister of Labour, Minister of Public Health and Acting Minister of Public Welfare; the Minister of Highways and Public Works; the Minister of Agriculture and Marketing who is also Minister of Lands and Forests; the Minister of Trade and Industry; the Minister of Education; the Minister of Municipal Affairs; and one Minister without portfolio who is in charge of the administration of the Nova Scotia Liquor Control Act. The House of Assembly has 37 members elected for five years, the maximum duration of its existence.

The Premier of the Province receives a salary of \$9,000 per annum and each Cabinet Minister a salary of \$8,000 per annum. Each member of the House of Assembly receives a sessional indemnity of \$1,600 and an allowance of \$800 for expenses incidental to the discharge of his duties. The Leader of the Opposition receives an allowance of \$1,000 in addition to his sessional indemnity.

**Subsection 4.—New Brunswick**

The Province of New Brunswick has a Lieutenant Governor, Executive Council and House of Assembly. The Executive Council is composed of: the Premier and Attorney General; the Provincial Secretary-Treasurer and President of the Executive Council; the Minister of Public Works; the Minister of Lands and Mines; the Minister of Agriculture; the Minister of Health and Social Services; the Minister of Labour; the Minister of Education and Municipal Affairs; the Minister of Industry and Development; and a Minister without portfolio who is the Chairman of the New Brunswick Electric Power Commission. The Legislative Assembly has 52 members who are elected for a term of five years.

The Premier receives a salary of \$5,000 which is in addition to any other portfolio he may hold. The salary of each Cabinet Minister is \$5,000, the amount paid as indemnity to each Member is \$1,500 and the Leader of the Opposition receives an additional \$2,000. An allowance of \$1,000, in addition to the regular indemnity, is made to the Speaker.

# 17.—Lieutenant-Governors of New Brunswick, 1867-1950, Legislatures and Premiers, 1934-50, and Present Ministry as at June 1, 1950

NOTE.—See headnote to Table 14, p. 85.

Minister without portfolio (Chairman of the New Brunswick Electric Power Commission).....	Hon. ISAIE MELANSON.....	Aug. 11, 1949	Aug. 11, 1949

## Subsection 5.—Quebec

The Executive Council is composed of the Lieutenant-Governor and the Ministers of the Crown. These are: the Premier and President of the Executive Council; the Solicitor General; the Provincial Treasurer; the Minister of Lands and Forests; the Minister of Health; the Minister of Municipal Affairs; the Minister

of Colonization; the Minister of Mines; the Minister of Agriculture; the Minister of Roads; the Minister of Labour; the Minister of Game and Fisheries; the Minister of Public Works; the Minister of Social Welfare and of Youth; the Minister of Trade and Commerce; the Provincial Secretary; and five Ministers without portfolio. The Legislative Council has 24 members nominated for life by the Lieutenant-Governor in Council.

The Legislative Assembly has 92 members and, like the Legislative Council, has the power to bring forward bills relating to civil and administrative matters and to amend or repeal the laws that already exist. A Bill, to be approved by the Lieutenant-Governor, must have received the assent of both Houses. Only the Legislative Assembly can bring forward a Bill requiring the expenditure of public money. The extreme length of a Legislature is five years.

Salaries and allowances of the Premier, members of the Executive Council, Legislative Council and Legislative Assembly are fixed according to the Revised Statutes (1941), c. 4, as amended by 10 Geo. VI, c. 11, as follows: all members of the Legislative Assembly and Legislative Council receive \$3,000 per annum as salary and \$1,000 by way of allowances; in addition the Premier receives \$10,000 as salary and \$4,000 allowances; Ministers with portfolio an additional \$6,000 as salary and \$2,000 allowances; Ministers without portfolio an additional \$2,000 salary and \$2,000 allowances; the Leader of the Opposition in the Legislative Assembly an additional \$6,000 salary and \$2,000 allowances; the Leader of the Opposition in the Legislative Council an additional \$2,000 allowances.

### Subsection 6.—Ontario

The Executive Council of Ontario consists of: the Premier, President of the Council and Provincial Treasurer; Minister of Agriculture; Minister of Mines; Attorney General and Minister of Education; Minister of Highways and Minister of Public Works; Minister of Municipal Affairs; Minister of Reform Institutions; Minister of Labour; Provincial Secretary and Registrar; Minister of Health; Minister of Planning and Development; Minister of Public Welfare; Minister of Lands and Forests; Minister of Travel and Publicity; and one Minister without portfolio.

The House of Assembly, the single-chamber Legislature of the Province, is composed of 90 members elected for five years on an adult-suffrage basis.

Besides the regular departments the Niagara Parks Commission, the Ontario Municipal Board, the Hydro-Electric Power Commission of Ontario, the Ontario Northland Transportation Commission, the Liquor Control Board and the Liquor Licence Board have been created.

Under the provisions of the Legislative Assembly Amendment Act, 1947 (11 Geo. VI, c. 55), each Member of the Assembly is paid an annual indemnity of \$2,000 and an allowance for expenses of \$1,000. The Speaker receives an additional indemnity at the annual rate of \$2,500; the Chairman of the Committee of the Whole an indemnity at the annual rate of \$1,000 and the Leader of the Opposition an additional indemnity of \$3,000 and an annual allowance for expenses of \$2,000. These special indemnities and allowances for the Speaker, Chairman of the Committee of the Whole and Leader of the Opposition are in addition to their indemnities and expense allowances as Members of the Legislature.

Each Member of the Cabinet receives the ordinary indemnity as a Member of the Legislature of \$2,000 plus the \$1,000 expense allowance in addition to his salary as a Member of the Crown. The salary provided for a Cabinet Minister in the Executive Council Act is \$10,000 but at the present time and for some years past each Member of the various Cabinets has voluntarily surrendered \$2,000 annually, drawing \$8,000 each as his Ministerial salary.

### 19.—Lieutenant-Governors of Ontario, 1867-1950, Legislatures and Premiers, 1934-50, and Present Ministry as at June 1, 1950

## Subsection 7.—Manitoba

Besides its Lieutenant-Governor, Manitoba has a Provincial Executive composed of 10 men and a Legislative Assembly of 57 elected for five years.\* The Provincial Executive, headed by the Premier and President of the Council, who is also Provincial Treasurer and Minister of Dominion-Provincial Relations, consists of: the Minister of Agriculture and Immigration; the Minister of Labour, who is also Provincial Secretary; the Municipal Commissioner; the Minister of Mines and Natural Resources, who is also the Minister presiding over the Department of Industry and Commerce; the Attorney General; the Minister of Public Utilities, who is the Minister under the Manitoba Power Commission Act, the Manitoba Telephone Act and the Municipal and Public Utility Board Act; the Minister of Health and Public Welfare; the Minister of Education; the Minister of Public Works.

\* During the 1949 session of the Legislature an Act was passed to amend the Legislative Assembly Act to change the membership from 55 members plus the three representatives of the Armed Forces to 57 members. This new membership was made effective at the General Election in November, 1949.

The Premier of the Province is paid a salary of \$8,000 per annum and each of the other Members of the Cabinet \$6,000. The Members of the Legislature are each paid an indemnity and an allowance of \$2,500, being made up of \$1,670 indemnity and \$830 as an expense allowance. The Leader of the Opposition group in the Legislature is paid an additional amount of \$2,000. The Speaker of the Legislature is paid a salary of \$2,500 in addition to the indemnity and expense allowance.

### Subsection 9.—Alberta

There are ten members of the Executive Council of Alberta: the Premier and Provincial Treasurer; the Minister of Agriculture; the Minister of Economic Affairs; the Minister of Education; the Minister of Public Works, who is also responsible for the Department of Railways and Telephones; the Minister of Mines and Minerals, and Lands and Forests; the Minister of Health and Minister of Public Welfare; the Minister of Municipal Affairs and Provincial Secretary; the Attorney General; and the Minister of Industries and Labour.

There are 57 members of the Legislative Assembly who are elected for a maximum period of five years.

The salary of the President of the Executive Council is \$9,000 and of a Cabinet Minister \$7,000. Since no party is recognized as the official opposition, a special allowance of \$750 is paid to the Leaders of the Liberal and Co-operative Commonwealth Federation parties. The sessional indemnity for each Member of the Legislative Assembly is \$2,000 plus an expense allowance of \$1,000.

## 22.—Lieutenant-Governors of Alberta, 1905-1950, Legislatures and Premiers, 1934-50, and Present Ministry as at June 1, 1950

### Subsection 10.—British Columbia

British Columbia has a Lieutenant-Governor and an Executive Council composed of: the Premier and President of the Council; Provincial Secretary and Minister of Education; Attorney General; and the Ministers of Lands and Forests, Finance, Agriculture, Mines and Municipal Affairs, Public Works, Railways, and Trade and Industry and Fisheries, Labour, and Health and Welfare. The Legislative Assembly, elected for five years, has 48 members.

Members of the Executive Council and the Legislative Assembly each receive sessional allowances of \$2,000 and \$1,000 for expenses. The Premier receives a salary of \$9,000 and each Member of the Executive Council \$7,500 in addition. The Leader of the Opposition has a special allowance of \$2,000 and the Speaker and Deputy Speaker receive allowances of \$1,800 and \$500, respectively.

### 23.—Lieutenant-Governors of British Columbia, 1871-1950, Legislatures and Premiers, 1934-50, and Present Ministry as at June 1, 1950

NOTE.—See headnote to Table 14, p. 85.

#### Subsection 11.—Yukon and the Northwest Territories

**Yukon.**—The Yukon Act provides for a local government composed of a Chief Executive, styled Commissioner, who is appointed by the Governor in Council, and an elective Territorial Council of three members having a three-year tenure

of office. The Yukon Territorial Council performs much the same functions as do the Provincial Governments. The Commissioner functions in lieu of the Provincial Cabinet and the three members of the Territorial Council function in lieu of the Provincial Legislature. The seat of local government is at Dawson, but the Commissioner acts under instructions from the Governor in Council or the Minister of Resources and Development at Ottawa.

COMMISSIONER (as at June 1, 1950)

JOHN EDWARD GIBBEN..... Sept. 13, 1947

TERRITORIAL COUNCIL (as at June 1, 1950)

(Three members elected 1949, for 3 years)

Dawson District..... CHARLES J. LELIÈVRE

Whitehorse District..... R. GORDON LEE

Mayo District..... ERNEST J. CORP

**Northwest Territories.**—The government of the Northwest Territories is vested in a Commissioner, assisted by a Council composed of six members all of whom are appointed by the Governor in Council. The administration of the various Acts, Ordinances and Regulations pertaining to the Northwest Territories is supervised by the Director of the Development Services Branch of the Department of Resources and Development, who is also Deputy Commissioner. The seat of government is at Ottawa. As at June 1, 1950, the Government was:—

TERRITORIAL COUNCIL (as at June 1, 1950)

Commissioner..... HUGH L. KEENLEYSIDE

Deputy Commissioner..... ROY A. GIBSON

Members of the Council.... LOUIS C. AUDETTE, HAROLD B. GODWIN, DONALD M. MACKAY  
JOHN G. MCNIVEN, STUART T. WOOD

Secretary..... JAMES G. WRIGHT

### Section 3.—Municipal Government\*

The earliest local government in Canada was carried out by the seigneurs of New France who, along with military command and the administration of justice, bore the responsibilities of appointing justices of the peace and clerks of roads. Some were soon replaced by a 'syndic' elected by the people, the first in 1644, though a mayor and two aldermen had briefly held office in the city of Quebec in 1643. However, the 'syndics' fell into disuse, and powers were delegated by the Governor to officials. The city of Quebec was incorporated in 1831, and a system of local government for the Province, decreed in 1840, was remodelled by Acts of 1845, 1847, 1850 and 1860.

Meanwhile, in the Atlantic Provinces, Saint John, N.B., had attained the distinction of becoming Canada's first incorporated city in 1784. Incorporation of Halifax, N.S., came in 1849 and Charlottetown, P.E.I., in 1855. In the Province of Newfoundland, St. John's was created a town in 1888. In Ontario, the Parish and Town Officers Act of 1793 provided for an annual meeting in a parish or township to appoint local officers but these were responsible to Parliament and the courts and the meetings had no law-making powers. Brockville, in 1832, gained some local powers from the Governor in Council which had previously been exercised through

\*Prepared in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

the courts. Other localities soon followed suit and in 1834 York was incorporated as the self-governing city of Toronto. Further steps led to the Municipal Act of 1849, which is the foundation of the local government of to-day in Ontario and later provided a model for the Western Provinces. Subsequently, Acts have been passed in all provinces governing aspects of municipal incorporation, powers and duties.

Municipal government in every province of Canada existed in at least elementary form before Confederation. With such a background, the provision of the British North America Act that jurisdiction over municipal affairs would rest with the provinces has resulted, quite naturally, in dissimilarity in the organization of local government across the country. This stems not only from the difference in beginnings and subsequent independent growth in each province, but also from variations in requirements arising out of geographical and population differences.

The situation remains in a state of flux, with constant amendment of provincial Acts and charters in the attempt to solve old problems and to meet new ones. Just as the call for new and additional services has enlarged the scope of federal and provincial activities, the municipalities have had to assume responsibilities unheard of, or considered beyond their sphere of activity, a few decades ago. As a result, amendments to Acts have varied from those enlarging the powers and the boundaries of municipalities, to those establishing closer provincial control and greater financial aid.

The chief forms of municipal organization at present extant in the provinces of Canada are given in the following paragraphs.\*

**Newfoundland.**—Newfoundland has only one city, <sup>1</sup>St. John's. The remainder of the population is mostly dispersed in small settlements around the coastline, and only since the passage of the Local Administration Act of 1937 have a few of the larger of these been set up individually with local councils as towns, or where two or three are close together, as rural districts (9 by 1949). These latter are not rural municipalities but merely towns consisting of two or more settlements. Local affairs in the remainder of the Province are administered by the Provincial Government.

**Prince Edward Island.**—The city of Charlottetown and seven towns, all incorporated by special Acts, comprise the total municipal organization in Prince Edward Island. They include less than one-half of one per cent of its total area and only one-quarter of its population. The remainder of the population is not organized municipally, as the three counties are purely provincial administrative units.

**Nova Scotia.**—Municipal organization in Nova Scotia covers the whole of the Province. Halifax and Sydney are the only two cities and operate under special charters, with the latter also governed by some special legislation. Towns, which number 41, operate under the Town Incorporation Act. There are no municipalities incorporated as villages. Cities and towns are independent of counties. The rural area is divided into 18 counties which, in themselves, do not represent units of local government. However, 12 of these counties each comprise one municipality, and the other six two municipalities each, making a total of 24 rural municipalities.

**New Brunswick.**—The Province is wholly divided into 15 counties which are incorporated municipalities and have direct powers of local self-government in the rural areas. In effect, therefore, they are the rural municipalities. In most cases certain of their powers apply in urban municipalities also. The three cities have

\* Municipalities are summarized by type of organization on p. 102.

special charters, and the 19 towns operate under the Towns Incorporation Act. There are also four villages and 30 local improvement districts.

**Quebec.**—Municipal divisions in Quebec cover about one-tenth of the more heavily settled portions, the remaining nine-tenths being governed by the Province as 'territories'. The organized area is divided into 76 county municipalities, which are themselves divided into local municipalities under the Municipal Code, designated as village, township or parish municipalities or simply as municipalities. The counties, as such, have no direct powers of taxation. Funds to finance the services falling within their jurisdiction are provided by the municipalities forming part thereof. Parts of some counties are not yet organized into incorporated units of local government, being in outlying districts with little or no population. In 1949 there were 328 villages and 1,097 townships and parishes. A small number of these are independent of the counties in which they are located. Of the 32 cities, a few have special charters. The remainder, along with the 129 towns, are governed by the Cities and Towns Act and numerous special Acts.

**Ontario.**—Slightly more than one-tenth of the area of Ontario is municipally organized, the remainder being governed entirely by the Provincial Government. The older section of the Province is divided into 43 counties, five of which are united with others for administrative purposes. Although incorporated municipalities, each county is comprised of the towns, villages and townships situated within its borders, which provide its revenues. There are 29 cities, 147 towns, 157 villages, 571 townships and 13 improvement districts. Some of each are located in the northern districts of the Province, which is not organized into counties.

**Manitoba.**—Only the southern and settled section of Manitoba, comprising less than one-eighth of the area, is organized for local self-government. As in the three other western provinces, there is no county organization, and all municipalities are independent, except of provincial control. There are four cities, three with special charters and one governed by a number of special Acts. General Acts govern the 33 towns, 33 villages, 109 rural municipalities and five suburban municipalities. An Act of 1944 (amended January, 1945) authorizes organization of "local government districts" in unorganized or disorganized territory.

**Saskatchewan.**—All municipalities in Saskatchewan derive their powers from general Acts that are designated with the name of the type of municipality. There are 8 cities, 84 towns, 401 villages and 304 rural municipalities. The area so organized consists of most of the southern two-fifths of the Province. The remainder of this portion is administered for local purposes by the Province in unincorporated local improvement districts. The northern three-fifths are sparsely populated and without local government.

**Alberta.**—In Alberta there are cities, towns, villages and rural municipalities known as municipal districts. The latter three classes come under general Acts, but each of the seven cities has its own charter. There are 62 towns, 138 villages and 57 municipal districts, but less than one-fifth of the Province is so organized. There are also some unincorporated improvement districts administered by the Province in less densely settled areas.

**British Columbia.**—British Columbia has less than 0.5 p.c. of its area organized into municipalities. Additional small areas have sufficient population to require administration of local activities by the Provincial Government. There are 35 cities, 39 villages and 27 districts, the latter being chiefly rural municipalities, except for those adjacent to the principal cities of Victoria and Vancouver and

are largely urban in character. It should be emphasized, however, that the application of the name "city" is somewhat different from the commonly accepted meaning in that several of them have populations of less than 1,000 and perhaps one-half or more would not normally be incorporated as cities in any other province.

#### 24.—Municipalities, by Type of Organization and by Provinces, 1949

<sup>4</sup> Includes 5 units of self-government officially known as "suburban municipalities".  
<sup>5</sup> Does not include 81 improvement districts.  
<sup>6</sup> Does not include 58 improvement districts.

### Section 4.—Federal-Provincial Relations

An outline of Federal-Provincial relations between the Dominion-Provincial Conference of December, 1936, and the conclusion of the post-war tax agreements of 1947 will be found at pp. 116-122 of the 1948-49 edition.

In the Terms of Union of Newfoundland with Canada (see pp. 56-57) the Government of Canada undertook to make an offer to the Government of Newfoundland to enter into a tax agreement similar to the offers made to the other provinces. Newfoundland, however, was given the option of an agreement expiring concurrently with the other agreements or one which expired five years later. Newfoundland selected the first option and an agreement was signed on Mar. 29, 1950. Thus eight provinces—Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, Manitoba, Saskatchewan, Alberta and British Columbia—have concluded tax agreements to rent their corporation tax, income tax and succession duty fields to the Federal Government.

The Federal Government gave an undertaking that a new general conference with the Provincial Governments would be held at least one year prior to the expiration of the tax agreements on Mar. 31, 1952. In accordance with this undertaking, a conference was held at Ottawa, Dec. 4 to 7, 1950. The Prime Minister stated in his opening remarks that the gravity of the international situation with its implications for defence spending seemed to make it desirable to limit the subject matter of the conference discussions. He suggested that it might be well, therefore, to consider first the two matters in which there was the greatest interest—fiscal arrangements and old age security.

The Federal Government offered to enter into new tax rental agreements at the expiry of the present agreements in 1952 on a basis similar to that now in use.

The new agreements would again cover a 5-year period but the guaranteed minimum payments would be on a 1948 rather than a 1942 basis. This would be accomplished by adjusting the present guaranteed minimum payment for each province upward in the same proportion as Canadian gross national product per capita and the population of that province had changed between 1942 and 1948. Accompanying this change in the guaranteed minimum payments were two changes in the method of annual adjustment. In the first place a 2-year average of the relevant factors was proposed instead of the 3-year average now used. In the second place it was proposed to substitute the gross national product at factor cost for the gross national product at market prices as one of the two adjusting factors. The result of this latter modification would be that changes in the level of indirect taxation would not have a direct bearing upon the annual tax rental payments.

The Federal Government also offered a new option which would be more favourable to provinces with a relatively high tax potential. This additional option specified that any province might take as its guaranteed minimum annual payment the sum of the following amounts:—

- (1) The yield of a personal income tax at 5 p.c. of 1948 federal rates applied to 1948 incomes in the province.
- (2) The yield of a tax of  $8\frac{1}{2}$  p.c. on corporation profits earned in the province in 1948.
- (3) The average revenue received by the province from succession duties.
- (4) Statutory subsidies payable to the province for 1948.

The Prime Minister also stated that the Federal Government was prepared to bring into effect an old age security plan along the lines recommended by the Parliamentary Committee earlier in the year. This Committee had recommended federal old age pensions of \$40 a month to all persons of 70 years of age and over financed, in large part, on a contributory basis. To bring this into effect a constitutional amendment would be necessary. The Committee had also recommended that pensions of the same amount be paid to persons in need between the ages of 65 and 69 with financial responsibility shared equally between the Federal and Provincial Governments. The Conference considered these proposals in committee and agreed that the text of the amendment to give Parliament the power to institute universal contributory old age pensions for persons aged 70 and over should be drafted and circulated to the provincial governments for their approval. A continuing committee was established to consider the character of legislation that would be appropriate respecting persons between the ages of 65 and 69 and to what groups and under what conditions it should be made applicable in each province. This continuing committee was to meet as soon as decisions had been reached by the Provincial Governments concerning the constitutional amendment.

The Conference also discussed the desirability of amending the constitution to permit Provincial Legislatures to levy an indirect sales tax at the retail level. A draft of a constitutional amendment for this purpose was to be prepared and circulated to the Provincial Governments for consideration.

The proposals and their implications were examined in committee until the afternoon of Dec. 7, at which time the Conference was adjourned.

During the latter part of 1949 and in 1950 the Federal and Provincial Governments began an examination of the method of amending the Constitution of Canada.

The lack of a clause in the British North America Act to provide a means by which the Act can be amended in Canada, without action each time by the United Kingdom Parliament, has frequently given rise to difficulty. Recourse to the United Kingdom Parliament for amendments has also been felt to be an improper

burden on the latter and out of keeping with the status of Canada. The Provinces have always had the right, under the B.N.A. Act, to amend their constitutions, but there has been no similar provision under which the Parliament of Canada could amend the purely Federal Constitution, or under which parts of the constitution of joint federal-provincial concern could be amended in Canada. On Sept. 14, 1949, the Prime Minister informed the Premiers of the Provinces that Parliament would be asked at its next session to pass an Address requesting an amendment of the British North America Act which would give the Parliament of Canada power to amend the Canadian constitution in relation to its purely federal aspects. The Prime Minister also suggested that a conference should be held to discuss with the provinces the method of amending the parts of the constitution that concern both the federal and the provincial authorities.

An Address by the Parliament of Canada was moved by the Prime Minister on Oct. 17, 1949, and led to the passage by the United Kingdom Parliament of the British North America (No. 2) Act, 1949, on Dec. 16, 1949. Under the Act the Parliament of Canada now has the power to amend the purely federal portions of the Canadian Constitution.

The Federal-Provincial Conference to discuss methods of amending the parts of the constitution of joint concern met from Jan. 10 to 12, 1950. The Conference agreed that, to simplify consideration, it would be desirable to classify the various sections of the B.N.A. Act and other constitutional enactments according to the extent of federal and provincial participation that would be desirable in amendment of each. For the purpose, the provisions of the constitution were to be grouped under six heads:

- (1) provisions which concern parliament only, which should be amended by an Act of Parliament;
- (2) provisions which concern the provincial legislatures only, which should be amended by Acts of the Legislatures;
- (3) provisions which concern Parliament and one or more but not all of the Provincial Legislatures, which should be amended by an Act of Parliament and an Act of the Legislature of each province affected;
- (4) provisions which concern Parliament and all of the Provincial Legislatures, which should be amended by an Act of Parliament and Acts of such majority of the Legislatures and upon such additional conditions, if any, as might be decided upon;
- (5) provisions concerning fundamental rights, and amendment of the amending procedures, which should be amended by an Act of Parliament and Acts of the Legislatures of all the provinces;
- (6) provisions which should be repealed.

The Conference agreed that the Federal and Provincial Governments should submit their recommendations for classification to a standing committee of Attorneys General which should try to harmonize the different views.

The Committee of Attorneys General met from Aug. 21 to 23, 1950. It found that there was unanimity in the submissions by the governments on the classification of several sections and substantial agreement concerning others. During the course of the Committee's sessions, further agreement was reached. The Minister of Justice, as Chairman of the Committee of Attorneys General, reported to the Second Session of the Constitutional Conference which met in Quebec from Sept. 25 to 28. (In submitting his report, the Minister stated that, as a result of the discussions of the Committee, there remained, out of a total of 147 sections, approximately 30 sections of substantive importance which might be regarded as the more difficult ones upon which to reach agreement.) The Conference discussed some of the points on which difficulty of classification had been encountered, as well as other questions of a constitutional character, and directed the Committee

of Attorneys General to resume its studies with a view to reaching general agreement. The Committee was also authorized to study the methods and techniques through which a Canadian constitution could be domiciled in Canada as a purely Canadian instrument.

The Committee of Attorneys General met briefly at Ottawa in November and it is to resume its sessions after the Federal and Provincial Governments have disposed of the matters discussed at the Conference of Dec. 4-7, 1950.

### PART III.—CANADA'S EXTERNAL RELATIONS

#### Section 1.—Canada's Growth in External Status

The evolution of Canada in its external relations is reflected in the growth of the Department of External Affairs. A review of the organization and development of that Department is given at pp. 74-79 of the 1945 edition of the Year Book.

#### Section 2.—Canada and the United Nations

An outline of the organization of the United Nations and Canada's place therein appears at pp. 82-86 of the 1950 Year Book. Additional material appeared at pp. 122-125 of the 1948-49 edition and pp. 134-139 of the 1950 edition.

### PART IV.—DIPLOMATIC REPRESENTATION\*

#### Section 1.—Representatives of Canada in Other Countries

##### **Argentina:** (Established 1941.)

*Ambassador:* MR. J. D. KEARNEY, M.C., K.C. (presented Letter of Credence Sept. 22, 1949).

Address: Bartolome Mitre, 478, Buenos Aires.

##### **Australia:** (Established 1939.)

*High Commissioner:* MAJOR-GENERAL THE HON. L. R. LAFLECHE, D.S.O.

Address: State Circle, Canberra.

##### **Belgium:** (Established 1939.)

*Ambassador:* LIEUTENANT-GENERAL MAURICE POPE, C.B., M.C. (presented Letter of Credence Aug. 3, 1950).

Address: 46, Rue Montoyer, Brussels.

##### **Brazil:** (Established 1941.)

*Ambassador:* MR. J. S. MACDONALD (presented Letter of Credence June 3, 1948).

Address: Avenida President Wilson, 165, 7th Floor, Rio de Janeiro.

##### **Chile:** (Established 1942.)

*Ambassador:* MR. C. F. ELLIOTT, C.M.G., K.C. (presented Letter of Credence Apr. 3, 1947).

Address: Bank of London and South America Bldg., Santiago.

##### **China:** (Established 1942.)

*Ambassador:* (Vacant)

Address: 147 Hankow Road, Nanking.

##### **Cuba:** (Established 1945.)

*Ambassador:* DR. E. H. COLEMAN, C.M.G., K.C. (Nominated).

Address: Avenida de las Misiones No. 17, Havana.

\*Revised by the Department of External Affairs, Ottawa, as at Aug. 31, 1950.

**Czechoslovakia:** (Established 1942.)

*Chargé d'Affaires ad interim:* MR. E. B. ROGERS.

Address: Krakowska 22, Prague, 2.

**Denmark:** (Established 1946.)

*Third Secretary and Chargé d'Affaires ad interim:*

Address: Osterbrogade 26, Copenhagen.

**Finland:** (Established 1949.)

*Minister:* MR. T. A. STONE.

Address: c/o Canadian Legation, Strandvagen 7-C, Stockholm, Sweden.

**France:** (Established 1928.)

*Ambassador:* MAJOR-GENERAL GEORGE P. VANIER, D.S.O., M.C. (presented Letter of Credence Dec. 20, 1944).

Address: 72 avenue Foch, Paris XVI.

**Greece:** (Established 1943.)

*Ambassador:* MR. GEORGE L. MAGANN (presented Letter of Credence Nov. 23, 1949).

Address: 31 Queen Sofia Boulevard, Athens.

**Iceland:** (Established 1949.)

*Minister:* MR. E. J. GARLAND.

Address: c/o Canadian Legation, Fridtjof Nansens Plass 5, Oslo, Norway.

**India:** (Established 1946.)

*High Commissioner:* MR. W. F. CHIPMAN, K.C.

Address: 4 Aurangzeb Road, New Delhi.

**Ireland:** (Established 1940.)

*Ambassador:* THE HON. W. F. A. TURGEON, K.C. (presented Letter of Credence July 17, 1950).

Address: 92 Merrian Square West, Dublin.

**Italy:** (Established 1947.)

*Ambassador:* MR. JEAN DÉSY, K.C. (presented Letter of Credence June 26, 1948).

Address: Via Saverio Mercadante 15, Rome.

**Luxembourg:** (Established 1945.)

*Minister:* LIEUTENANT-GENERAL MAURICE POPE, C.B., M.C. (presented Letter of Credence July 28, 1950).

Address: c/o Canadian Embassy 46, Rue Montoyer, Brussels, Belgium.

**Mexico:** (Established 1944.)

*Ambassador:* MR. C. P. HÉBERT (presented Letter of Credence Feb. 24, 1949).

Address: Edificio Internacional, Paseo de la Reforma, No. 1, Mexico City.

**Netherlands:** (Established 1939.)

*Ambassador:* MR. P. DUPUY, C.M.G. (presented Letter of Credence Mar. 18, 1947).

Address: Sophialaan 1A, The Hague.

**New Zealand:** (Established 1940.)

*High Commissioner:* MR. A. RIVE (June 1, 1946).

Address: Government Life Insurance Bldg., Customs Quay, Wellington.

**Norway:** (Established 1943.)

*Minister:* MR. E. J. GARLAND (presented Letter of Credence Oct. 21, 1947).

Address: Fridtjof Nansens Plass 5, Oslo.

**Pakistan:** (Established Dec 2, 1949).*High Commissioner:* Mr. D. M. Johnson.

Address: Karachi (P.O. Box 563).

**Peru:** (Established 1944.)*Ambassador:* MR. E. VAILLANCOURT (Nominated).

Address: Edificio Boza, Plaza San Martin, Lima.

**Poland:** (Established 1942.)*Chargé d'Affaires ad interim:* MR. E. D. McGREER.

Address: Hotel Bristol, Warsaw.

**Sweden:** (Established 1947.)*Minister:* MR. T. A. STONE (presented Letter of Credence June 10, 1949).

Address: Strandvagen 7-C, Stockholm.

**Switzerland:** (Established 1947.)*Minister:* MR. V. DORE, C.M.G. (Nominated).

Address: Thunstrasse 95, Berne.

**Turkey:** (Established 1947.)*Ambassador:* MAJOR-GENERAL VICTOR W. ODLUM, C.B., C.M.G., D.S.O., V.D.  
(presented Letter of Credence Nov. 26, 1947).

Address: 211, Ayranci Baglari Kavaklidere, Ankara.

**Union of South Africa:** (Established 1940.)*High Commissioner:* MR. T. W. L. MACDERMOT (Nominated).

Address: 24 Barclays Bank Bldg., Church Square, Pretoria.

**Union of Soviet Socialist Republics:** (Established 1942.)*Chargé d'Affaires ad interim:* MR. JOHN B. C. WATKINS (appointed August, 1948).

Address: 23 Starokonyushny Pereulok, Moscow.

**United Kingdom:** (Established 1880.)*High Commissioner:* MR. L. D. WILGRESS (Mar. 16, 1949).

Address: Canada House, Trafalgar Square, London, S.W. 1.

**United States of America:** (Established 1927.)*Ambassador:* MR. H. H. WRONG (presented Letter of Credence Nov. 8, 1946).

Address: 1746 Massachusetts Avenue, Washington, D.C.

**Yugoslavia:** (Established 1948.)*Chargé d'Affaires ad interim:* MR. G. G. CREAN (Nominated).

Address: Garašaninova 20, Belgrade.

## MILITARY AND LIAISON MISSIONS

**Germany:***Head of Mission:* HON. T. C. DAVIS, K.C.

Address: Zittelmannstrasse 14, Bonn.

**Japan:***Head of Liaison Mission:* MR. E. H. NORMAN.

Address: 16 Omote-Machi, 3 Chome, Minato-Ku, Tokyo

## CONSULATES

**Brazil:***Consul:* MR. J. C. VAN TIGHEN.

Address: Rua 7 d'Abril 252, São Paulo.

**China:**

*Consul General:* DR. GEORGE S. PATTERSON.

Address: 27 The Bund, Shanghai.

**Germany:**

*Consul:* MR. W. S. DURDIN.

Address: 145 Fuerstenbergerstr., Frankfurt.

**Portugal:**

*Acting Consul General:* MR. L. S. GLASS.

Address: Rua Rodrigo Fonseca, 103-4°, Lisbon.

**Switzerland:**

*Consul:* MR. N. F. H. BERLIS.

Address: La Pelouse, Palais des Nations, Geneva.

**United States of America:**

Boston 16, Mass.

*Consul:* MR. T. F. M. NEWTON.

Address: 532 Little Building, 80 Boylston Street.

Chicago 6, Ill.

*Consul General:* MR. D. S. COLE.

Address: Suite 800, Daily News Building, 400 W. Madison Street

Detroit 26, Mich.

*Consul:* MR. JAMES J. HURLEY.

Address: 1035 Penobscot Building.

New York, N.Y.

*Consul General:* MR. K. A. GREENE, O.B.E.

Address: 620 Fifth Avenue.

Portland, Maine.

*Honorary Vice Consul:* MR. A. LAFLEUR.

Address: Office 503, 120 Exchange Street.

San Francisco 4, Cal.

*Consul General:* MR. HARRY A. SCOTT.

Address: 400 Montgomery Street.

**Venezuela:**

*Consul General:* MR. E. TURCOTTE.

Address: No. 805, Edificio America, Esquina Veroes, Caracas.

**Republic of the Philippines:**

*Consul General:* MR. F. H. PALMER, M.C.

Address: 12 Escolata, Manila.

**Section 2.—Representatives of Other Countries in Canada****Argentina:** (Established 1941.)

*Ambassador:* DR. AGUSTIN NORES MARTINEZ (Feb. 7, 1950).

Address: 193 Sparks Street, Ottawa.

**Australia:** (Established 1940.)

*High Commissioner:* THE RT. HON. FRANCIS M. FORDE, P.C. (Jan. 18, 1947).

Address: 100 Sparks Street, Ottawa.

**Belgium:** (Established 1937.)

*Ambassador:* HIS EXCELLENCY VICOMTE DU PARC, C.V.O. (Feb. 8, 1949)

Address: 170 Laurier Avenue East, Ottawa.

**Brazil:** (Established 1941.)

*Ambassador:* HIS EXCELLENCY DR. ACYR DO NASCIMENTO PAES (Apr. 26, 1946).  
Address: 111 Sparks Street, Ottawa.

**Chile:** (Established 1942.)

*Ambassador:* HIS EXCELLENCY GENERAL ARNALDO CARRASCO (June 5, 1947).  
Address: Suite 215, 56 Sparks Street, Ottawa.

**China:** (Established 1942.)

*Ambassador:* HIS EXCELLENCY LIU CHIEH (June 7, 1947).  
Address: 201 Wurttemberg Street, Ottawa.

**Cuba:** (Established 1945.)

*Chargé d'Affaires ad interim:* MR. ORLANDE DE LARA (Aug. 30, 1949).  
Address: Chateau Laurier Hotel, Ottawa.

**Czechoslovakia:** (Established 1942.)

*Chargé d'Affaires ad interim:* MR. ZDENĚK ROŠKOT (Feb. 10, 1950).  
Address: 171 Clemow Avenue, Ottawa.

**Denmark:** (Established 1946.)

*Minister:* HIS EXCELLENCY G. B. HOLLER (Mar. 7, 1946).  
Address: 107 Sparks Street, Ottawa.

**Finland:** (Established 1947.)

*Minister:* HIS EXCELLENCY URHO VILPITON TOIVOLA (Jan. 7, 1948).  
Address: 140 Wellington Street, Ottawa.

**France:** (Established 1928.)

*Ambassador:* HIS EXCELLENCY HUBERT GUERIN (Sept. 25, 1949).  
Address: 42 Sussex Street, Ottawa.

**Greece:** (Established 1942.)

*Ambassador:* HIS EXCELLENCY CONSTANTINE SAKELLAROPOULO (Nov. 12, 1945).  
Address: Chateau Laurier Hotel, Ottawa.

**Iceland:** (Established 1947.)

*Minister:* HIS EXCELLENCY THOR THORS (Jan. 20, 1948).  
Address: Chateau Laurier Hotel, Ottawa.

**India:** (Established 1947.)

*High Commissioner:* THE HON. S. K. KIRPALANI (Aug. 14, 1949).  
Address: 202 Elgin Street, Ottawa.

**Ireland:** (Established 1950.)

*Ambassador:* HIS EXCELLENCY SEAN MURPHY (Apr. 13, 1950).  
Address: 140 Wellington Street, Ottawa.

**Italy:** (Established 1947.)

*Ambassador:* HIS EXCELLENCY MARIO DI STEFANO (Nov. 8, 1948).  
Address: 384 Laurier Avenue East, Ottawa.

**Luxembourg:** (Established 1949.)

*Minister:* HIS EXCELLENCY HUGUES LE GALLAIS (Apr. 24, 1950).  
Address: Chateau Laurier Hotel, Ottawa.

**Mexico:** (Established 1944.)

*Ambassador:* HIS EXCELLENCY PRIMO VILLA MICHEL (Sept. 15, 1947).  
Address: 11 Metcalfe Street, Ottawa.

**Netherlands:** (Established 1939.)

*Ambassador:* HIS EXCELLENCY A. H. LOVINK (July 11, 1950).

Address: 168 Laurier Avenue East, Ottawa.

**New Zealand:** (Established 1943.)

*High Commissioner:* THE HON. T. C. A. HISLOP, C.M.G. (Aug. 25, 1950).

Address: 107 Wurtzburg Street, Ottawa.

**Norway:** (Established 1942.)

*Minister:* HIS EXCELLENCY DANIEL STEEN (Apr. 2, 1942).

Address: 140 Wellington Street, Ottawa.

**Pakistan:** (Established 1949.)

*High Commissioner:* THE HON. MOHAMMED ALI (July 9, 1949).

Address: 499 Wilbrod Street, Ottawa.

**Peru:** (Established 1944.)

*Ambassador:* HIS EXCELLENCY DR. LUIS CUNEO-HARRISON (Nominated).

Address: 111 Sparks Street, Ottawa.

**Poland:** (Established 1942.)

*Chargé d'Affaires:* MR. E. MARKOWSKI (May 12, 1950).

Address: 183 Carling Avenue, Ottawa.

**Sweden:** (Established 1943.)

*Minister:* HIS EXCELLENCY PER WIJCKMAN (Aug. 4, 1943).

Address: 720 Manor Road, Rockcliffe Park.

**Switzerland:** (Established 1945.)

*Minister:* HIS EXCELLENCY DR. VICTOR NEF (Apr. 25, 1946).

Address: 5 Marlborough Avenue, Ottawa.

**Turkey:** (Established 1944.)

*Ambassador:* HIS EXCELLENCY NUMAN TAHIR SEYMEY (May 5, 1950).

Address: Chateau Laurier Hotel, Ottawa.

**Union of South Africa:** (Established 1938.)

*High Commissioner:* THE HON. ALFRED ADRIAN ROBERTS, K.C. (Sept. 6, 1949).

Address: 15 Sussex Street, Ottawa.

**Union of Soviet Socialist Republics:** (Established 1942.)

*Chargé d'Affaires ad interim:* MR. MIKHAIL V. DEGTYAR (June 5, 1949).

Address: 285 Charlotte Street, Ottawa.

**United Kingdom:** (Established 1928.)

*High Commissioner:* THE HON. SIR ALEXANDER CLUTTERBUCK, K.C.M.G., M.C. (May 29, 1946).

Address: Earncliffe, Ottawa.

**United States of America:** (Established 1927.)

*Ambassador:* HIS EXCELLENCY THE HON. STANLEY WOODWARD (June 22, 1950).

Address: 100 Wellington Street, Ottawa.

**Uruguay:** (Established 1947.)

*Minister:* HIS EXCELLENCY CÉSAR MONTERO DE BUSTAMANTE (Mar. 11, 1948).

Address: 7 Delaware Avenue, Ottawa.

**Yugoslavia:** (Established 1947.)

*Minister:* HIS EXCELLENCY DR. RADE PRIBICEVIĆ (Nominated).

Address: 17 Blackburn Avenue, Ottawa.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing page 1 of this volume.

The records accumulated at the decennial censuses of Canada since Confederation in 1867 to the latest census to date, 1941, make a valuable contribution to the demographic history of the nation. Each successive decade has added to the vast scope of the material; the detailed statistical analyses and the numerous monographs and studies available under the several aspects of demography and agriculture have made the census a most important statistical measure of accomplishment and progress.

The salient aspects of population growth under each main heading shown in the conspectus are covered but not necessarily in any one edition. The Canada Year Book can do no more than summarize the broad results of the Census. More detailed information can be obtained from the census publications.

The main legal reason for a periodic census under the constitution of Canada is to determine representation in the House of Commons: this, according to the British North America Act, is based on population (see p. 65). The payment of provincial subsidies on a per capita basis is adjusted annually on population estimated from census data. In view of this each person is counted as belonging to the locality of his regular domicile, rather than to the place where he may be at the date of enumeration.

The modern nation-wide census, however important this redistribution purpose, has a much wider sphere of usefulness. It constitutes, through the data collected directly from the people, a true measure of the social and economic progress of the country and can, therefore, be used in the regulation and general administration of public affairs, social security and rehabilitation programs, etc.

**History of the Census.**—An outline of the history of the Census is given at pp. 96-97 of the 1947 edition of the Year Book.

**Growth of Population.**—A brief résumé of the population history of Canada from the first census in 1666, when 3,215 persons were enumerated, to the Census of 1941, when the figure was 11,506,655, places Canada among the leading countries of the Commonwealth in the rate of population growth. The inflow of capital

\* This Chapter has been revised in the Census (Demography) Division, Dominion Bureau of Statistics.

and the opening up of new and vast areas with the consequent stimulation of immigration in the early part of the twentieth century was the latest episode in the transformation of the central prairie region, which, in the course of 40 years, has been organized into provinces and developed with such promise. The total population of Canada at the end of the nineteenth century was approximately 5,400,000; it had about doubled this figure by 1931. The general increase in the population of European countries during the entire nineteenth century was approximately three-fold; Canada equalled this rate of progress during the 60 years from 1871 to 1931.

In the decade 1901-11 immigration alone totalled 1,800,000. This figure was the main factor in the gain of 34.2 p.c. registered by the total population of Canada in that decade, which was relatively larger than the growth of any modern country during the same period.

The next decade started out with an intensification of this immigration movement, but a recession set in with the outbreak of the First World War. The effects of that War upon the Canadian population were both direct and indirect. Nearly 60,000 members of the Canadian Forces died overseas and approximately 20,000 took their discharge in the United Kingdom. To these may be added 50,000 deaths from the war plague, influenza. In addition large numbers of British Isles residents, most of them recent immigrants, left Canada to join the Armed Forces of the United Kingdom and did not return; the same is true of enemy nationals who passed in considerable numbers into the United States immediately before and after the declaration of hostilities. The fluidity of the Canadian population accordingly rendered the War costly in personnel far beyond actual casualties. However, the net result over the ten years was a population increase of 21.9 p.c. or the largest increase for any modern country in that decade with the exception of Australia where an increase of 22.0 p.c. was recorded.

The Census of 1931 showed a further increase of 18 p.c. over 1921. Natural increase and immigration contributed 1,325,256 and 1,509,136, respectively, although the net gain was only 1,588,837 since estimated emigration was 1,245,555 for the ten years. Census returns of Great Britain for 1921-31 showed an increase of 4 p.c. as compared with 5 p.c. for the previous decade. New Zealand in the ten-year interval 1911-21 showed an increase of 21 p.c. and in the period 1921-36, 23 p.c. A census of Australia was not taken in 1931, but the official estimate of population based on that taken in 1933 gave an increase of 20 p.c. as against 22 p.c. for the period 1911-21. Census figures for the United States showed an increase in population of 15 p.c. for 1910-20, 16 p.c. for 1920-30 and 7 p.c. for 1930-40.

The eighth census of Canada taken June 2, 1941, gave the population as 11,506,655 as compared with 10,376,786 as of June 1, 1931, an increase of 1,129,869 or 11 p.c. in the decade. During the greater part of this decade, Canada, along with all other countries, was faced with a prolonged and severe economic depression; immigration was still further restricted by government regulations as well as by economic necessity. The figures for immigrant arrivals were actually reduced from 1,166,004 in the ten-year period 1921-31 to 140,361 in 1931-41. The natural increase for this period showed a reduction of about 11 p.c. and, since immigration was reduced more than 88 p.c. over the decade, the net increase in population was due almost entirely to the favourable birth and death rates of the established population.

# GROWTH IN CANADA'S POPULATION, 1851 - 1950

(ESTIMATED FOR INTERCENSAL YEARS, 1942-1950)

**Population Statistics for Newfoundland.**—On Mar. 31, 1949, the union of Newfoundland with Canada (see Chapter III) became effective. The latest Newfoundland census was taken in 1945 and it will not be possible to present population statistics on a really comparable basis with the other Canadian provinces until the Census of 1951 is taken. However, to meet demands for background information concerning the population of Newfoundland before union, a number of key tables based on previous Newfoundland censuses are given in Section 14 of Part II, pp. 132-135: in principle and so far as possible this presentation follows the Year Book treatment.

## PART I.—STATISTICS OF GENERAL POPULATION

### Section 1.—Growth of the Population

Since 1867, decennial censuses have been taken as of Apr. 2, 1871, Apr. 4, 1881, Apr. 5, 1891, Apr. 1, 1901, June 1, 1911, 1921, 1931 and June 2, 1941. Summary population figures are given in Table 1.

#### 1.—Population, by Provinces and Territories, Decennial Census Years 1871-1941

NOTE.—The populations of the Prairie Provinces in 1906, 1916, 1926, 1936 and 1946 are shown at p. 131. Intercensal estimated populations from 1867-1904 will be found at p. 141 of the 1936 Year Book; from 1905-30 at p. 127 of the 1946 edition; and from 1931-50 in Table 7, p. 121, of the present edition.

<sup>1</sup> Corrected as a result of the Boundaries Extension Acts, 1912. <sup>2</sup> Revised in accordance with the Labrador Award of the Privy Council, Mar. 1, 1927. The total for 1921 includes 485 members of the Royal Canadian Navy who were recorded separately. <sup>3</sup> Corrected by transfer of population of Fort Smith (368) to the Northwest Territories. <sup>4</sup> The decreases shown in the population of the Northwest Territories since 1891 are due to the separation therefrom of vast areas to form Alberta, Saskatchewan and Yukon and to extend the boundaries of Quebec, Ontario and Manitoba.

The land area and density of the population per square mile is given by provinces in Table 2 for the census years 1911-41. Similar information by counties or census divisions for the Census of 1941 is given at pp. 109-112 of the 1947 Year Book.

## 2.—Land Area and Density of Population, by Provinces and Territories, Census Years 1911-41

<sup>1</sup> The populations of Ontario, Quebec, Manitoba and the Northwest Territories were adjusted for 1911 according to the provisions of the Boundaries Extension Acts, 1912. <sup>2</sup> Revised in accordance with the Labrador Award of the Privy Council, Mar. 1, 1927. The total for 1921 includes 455 members of the Royal Canadian Navy who were recorded separately.

The growth of Canadian cities with populations of over 30,000 in 1941, together with date of incorporation as cities, is shown in Table 3. All urban centres having populations of 1,000 to 30,000 in 1941 are listed in Table 5.

## 3.—Cities (including Newfoundland) with Populations of Over 30,000 at the Latest Census compared with Census Years 1871 and 1891-1931

NOTE.—Cities in which a Board of Trade exists are indicated by an asterisk (\*), and those in which there is a Chamber of Commerce by a dagger (†). In all cases the populations for previous censuses have been adjusted to cover the same area as the 1941 Census. Figures for 1881 are given at p. 144 of the 1948-49 Year Book.

<sup>1</sup> The 1946 Quinquennial Census figures cover urban centres of the Prairie Provinces only. <sup>2</sup> Census of Newfoundland for 1935. <sup>3</sup> Census of Newfoundland for 1945. Includes all persons living within the incorporated limits of the city.

All the larger cities have in their neighbourhoods growing 'satellite' towns or other densely settled areas in close economic relationship with the central municipality. It has been advisable, therefore, to calculate the total populations for the metropolitan areas of these greater cities: they are shown for 1931 and 1941 in Table 4.

#### 4.—Population of Greater Cities, 1931 and 1941

Greater City	Population		Greater City	Population	
	1931	1941		1931	1941
	No.	No.		No.	No.
Montreal.....	1,023,158	1,139,921	Hamilton.....	163,710	176,110
Toronto.....	810,467	900,491	Windsor.....	110,385	121,112
Vancouver.....	308,340	351,491	Halifax.....	74,161	91,829
Winnipeg.....	284,652	290,540	London.....	<sup>1</sup>	86,740
Ottawa.....	175,988	215,022	Victoria.....	<sup>1</sup>	75,218
Quebec.....	172,517	200,814	Saint John.....	58,717	65,784

<sup>1</sup>Not included with Greater Cities in 1931.

#### 5.—Urban Centres having Populations of 1,000 to 30,000, by Provinces (including Newfoundland) at the Latest Census, compared with the Previous Census

NOTE.—Figures for the Censuses of 1901, 1911 and 1921 are given at pp. 145-149 of the 1948-49 Year Book.

## Section 2.—Movement of Population

The traditional movement of population on the North American Continent from east to west has not been apparent in Canadian statistics for recent years. Considerable variation is revealed by the intercensal comparison between 1931 and 1941, by the ration book counts of 1944 and 1946, and by the special survey of interprovincial migration covering 1946-47.

The most spectacular changes are shown in the Prairie Provinces and in British Columbia. The three Prairie Provinces lost by migration about 250,000 people between 1931 and 1941 and almost the same number from 1941 to 1946. British Columbia gained—during the 1930's at the rate of about 8,000 a year and during the 1940's at about 25,000 a year. According to the most recent figures available there is no sign of a falling-off in British Columbia's growth. On an absolute basis, Ontario received almost the same number of people as British Columbia; in relation to its larger population this growth was only one-quarter as important. Quebec's net change was very small relative to its population. Nova Scotia gained during the years 1939-45 and lost immediately after the Second World War, while the Maritime Provinces as a whole lost population over the past two decades.

## 6.—Net Interprovincial Migration, by Provinces, 1931-49

<sup>1</sup> Less than 500.

### Section 3.—Intercensal Estimates of Population

Intercensal estimates of the population serve many uses. They constitute a base for vital statistics rates, per capita figures of production and trade, and other analyses. More recently, they have proved useful for estimates of labour force and other population characteristics of data collected in sample surveys.

Estimates are constructed in the first place for the total population of Canada and for each province. It is a requirement that these be made available about the date to which they apply, June 1 of each year. As final figures on the components of population changes are not ready at that date, the numbers of births, deaths and immigrants are partly filled in by extrapolation so that a preliminary figure is secured for the June to May interval. To avoid a cumulative error the calculation, in effect, starts anew with the latest preceding census for each year's estimates and uses the most up-to-date figures then available. To the census figures are added the births of the intervening years and the deaths are subtracted. Immigrants are added and emigrants are subtracted. On the last item of this calculation there is least information; it is possible to ascertain from United States immigration figures, the number of Canadians entering the United States and sometimes the same for those going to the United Kingdom but data are not available for other countries.

The program of population estimates calls for two figures to be given in respect of each year; one based on preliminary materials, as described above, necessarily involving an extrapolation of birth, death and immigration returns, and the other on final figures subject to no further change which can be made available only when the last item of subsequent information has been secured. This last item is the succeeding decennial census. There is no theoretical gain in making minor adjustments that are within the band of error to which the figures are subject in any case, and such adjustments in practice cause confusion to users. Since estimates for successive years are independently calculated back to the latest census the best estimate of the balance of population change is not obtained by subtracting the figure for one year from that for the year following. Much interest attaches to the year-to-year balance and the following statement, which gives all available data on that point, is included.

Year	Calendar-Year Data				Estimated Population as at June 1 <sup>1</sup>
	Births	Deaths	Natural Increase	Immig- ration	
1941.....	255,224	114,500	140,724	9,325	11,490,000
1942.....	272,184	112,848	159,336	7,576	11,637,000 <sup>2</sup>
1943.....	283,423	118,531	164,892	8,502	11,795,000 <sup>2</sup>
1944.....	284,220	116,052	168,168	12,793	11,958,000 <sup>2</sup>
1945.....	288,730	113,414	175,316	22,711	12,102,000 <sup>2</sup>
1946.....	330,732	114,931	215,801	71,691	12,283,000 <sup>2</sup>
1947.....	359,094	117,725	241,369	64,127	12,582,000 <sup>2</sup>
1948.....	347,307	119,384	227,923	125,414	12,883,000 <sup>2</sup>
1949.....	350,847 <sup>3</sup>	119,578 <sup>3</sup>	231,269 <sup>3</sup>	95,217 <sup>3</sup>	13,549,000 <sup>2,4</sup>

<sup>1</sup> Exclusive of Yukon and the Northwest Territories.  
<sup>2</sup> These estimates are subject to adjustment as later data are made available.

<sup>3</sup> Exclusive of the Province of Newfoundland.

<sup>4</sup> Includes the Province of Newfoundland.

## 7.—Estimates of Population, by Provinces, Intercensal Years 1931-50

NOTE.—At every census the previous post-censal estimates, made at June 1 each year, are adjusted to the newly recorded population figures. Figures for 1867-1904 will be found at p. 141 of the 1936 Year Book and for 1905-30 at p. 127 of the 1946 edition. Figures for all provinces for 1931 and 1941 are census figures while for the Prairie Provinces are for the 1936 and 1946 Censuses.

Year	Nfld.	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Yukon	N. W.T.	Canada

<sup>1</sup> Subject to adjustment as later data are made available.

<sup>2</sup> Estimates for Newfoundland prior to union with Canada, which took place on Mar. 31, 1949, are not included in Canada totals.

## PART II.—ANALYSES OF GENERAL POPULATION

## Section 1.—Rural and Urban Population

The population residing in cities, towns and incorporated villages has been defined for census purposes as 'urban' and that outside such localities as 'rural'. The distinction between rural and urban populations in Canada, therefore, is a distinction of provincial legal status rather than of size of aggregation of population within a limited area. Since the laws of the various provinces differ in regard to the population necessary before a municipality may be incorporated as urban,\* the line of demarcation between rural and urban population is not uniformly drawn throughout Canada.

This basis of comparing rural and urban populations adhered to throughout the census analyses is adopted for Canada because the necessary comparable data over a long period of years required for comparison by degree of urbanization does not exist. Obviously, the populations of villages of less than 1,000 cannot be regarded as truly urban, although there is reason, for certain purposes, to distinguish them from the surrounding rural populations, in that they enjoy definite cultural advantages not possessed by the strictly rural municipalities.

Table 2 has been prepared to overcome some of the difficulties involved, and to provide a basis for comparison of urban centres by size with those of other countries. These data enable places outside any required size limits to be readily excluded. Similar data, by provinces, will be found in Vol. II of the Census of 1941.

\* In Saskatchewan the original legislation of 1908 provided that a community of 50 persons on an area not greater than 640 acres might be incorporated. Several amendments have since been made and, as the Act now stands, 100 people resident on an area not greater than 240 acres may be incorporated. The Ontario law, on the other hand, requires that a village, before it can be incorporated, must have a population of 750 on an area not exceeding 500 acres.

Over the forty years, 1911-41, there has been a radical shifting in the distribution of the Canadian population from rural to urban districts. The change has been continuous throughout the period. In the decade ended 1941 the proportion of urban population increased from 53.7 p.c. to 54.3 p.c. Urban communities absorbed over 60 p.c. of the total increase in population during that decade and the urban population of Canada in 1941 exceeded the rural by 998,177. Out of every 1,000 persons in the country, 457 were resident in rural and 543 in urban communities on June 2, 1941, as compared with 463 in rural and 537 in urban communities on June 1, 1931; 505 in rural and 495 in urban on June 1, 1921; and 546 in rural and 454 in urban on June 1, 1911. In this trend to urbanization of population, Canada is by no means unique. The same change has characterized virtually all western nations to a greater or less degree during the past century.

### 1.—Rural and Urban Populations, by Provinces and Territories, Census Years 1911-41

<sup>1</sup> Royal Canadian Navy (485) included in rural total.

Table 2 gives the distribution of urban population in Canada by size of urban centres; the rural-urban trend is very strongly indicated by the increased size of the larger cities and towns at a time when immigration (especially that of British origin), which in former decades tended to concentrate there, was negligible.

## Section 2.—Sex and Age Distribution

**Sex.**—The sex distribution of the Canadian people has been characterized since early colonial times by a preponderance of males, although this condition has been greatly modified in more recent years. In 1666, during the early years of settlement by French immigrants, 63·3 p.c. of the population were males. In 1784, when British immigration to Canada was commencing, there were 54,064 males and 50,759 females and by the middle of the nineteenth century there were 449,967 males to 440,294 females in Lower Canada and 499,067 males to 452,937 females in the more newly settled Upper Canada. Since Confederation the newer sections of Canada—the west and the northwest—have shown the greatest excess of males.

From 1871 to 1941, for Canada as a whole, the proportion of males never dropped below 51 p.c. of the total population, whereas for Western Canada it varied between 53 p.c. and 59 p.c.

### 3.—Sex Distribution of the Population, by Provinces and Territories, Census Years 1911-41

NOTE.—Figures for the Censuses of 1871, 1881, 1891 and 1901 are given at p. 150 of the 1948-49 Year Book.

<sup>1</sup> Includes 485 members of the Royal Canadian Navy recorded separately in 1921.

Immigration has influenced the sex distribution of the population, as between provinces, in widely different degree. In the older settlements of Quebec and parts of New Brunswick and Ontario, where the populations are of French basic stock, immigration has not played as great a part in upsetting the normal distribution of the sexes as it has in the other provinces. Even in Ontario immigrants from Continental European countries do not settle as readily and are not assimilated as completely as in the newer Western Provinces.

A characteristic of population distribution since 1911 has been the rapid growth of urban centres due to the far-reaching developments in manufacturing that have entirely changed the economic picture. Summary figures showing the disparity between the sexes in the matter of urban concentration in 1911, 1921, 1931 and 1941 in the total population are given in the following tabulation. In urban centres where the percentage of males is large the percentage of females is also large. Each decade emphasizes the greater opportunities for female employment in urban centres as compared with rural districts.

Item	1911	1921	1931	1941
Excess of all males over all females per 100 of total population.....	6·07	3·09	3·59	2·56
Percentage of females in urban centres to all females.....	47·12	51·78	55·98	56·61
Percentage of males in urban centres to all males.....	43·91	47·41	51·57	52·18
Excess of urban females over urban males per 100 of urban population.....	-2·54	1·32	0·52	1·52

Table 4 gives the position of Canada among other countries of the world in regard to masculinity.

#### 4.—Masculinity of the Population of Various Countries

<sup>1</sup> White population only.

Estimates of the population by age and sex for the intercensal years 1942-49 are given in Table 5, p. 125.

**Age.**—The age distribution of a population is fundamental to most, if not all, other analyses, for the age factor influences employment, marriage, birth rates and death rates, education, immigration, criminology and a multitude of events and activities that are of great importance in the national life.

Immigration has a strong influence on age distribution: it does not directly affect the very young sections of the population except to a small degree, but it immediately affects the age groups between the 'teens' and the 'twenties' and its effects are carried to the older groups as time goes by. Thus, the influence of the very heavy immigration of the early years of the century (1900-11) is indicated by the fact that, in 1901, 175 persons per 1,000 of the total population were in the age group 20-29 years and 130 persons per 1,000 in the group 30-39 years: a decade later, 190 per 1,000 were in the former group and 143 in the latter. Since immigration slowed down very decidedly after the outbreak of war in 1914, the influence of these earlier accretions to the population has crept through the upper age groups year by year until it has now reached those of the population in their 'fifties'.

Between 1931 and 1941 a more pronounced general ageing of the population is shown owing to practically non-existent migration and a lower birth rate—factors that were emphasized during the depression years. In 1921 the number per 1,000 of total population between 40 and 59 years of age was 183.0; it was 201 in 1931 and 209 in 1941. Greater proportional increases, however, are shown by the group 60 years of age or over; this group represented 75 per 1,000 of the total population in 1921, 84 in 1931 and no less than 102 per 1,000 in 1941.

**Estimates of Population by Sex and Age.**—The figures for 1941 in Table 5 are those of the Census. For the other years they are estimates, calculated from the Census figures, the births and deaths in each year, and known migration into and out of the country.

The starting point in this calculation is the population of the 1941 Census, taken at the beginning of June. The number of children under one year of age on June 1 of each subsequent year was obtained by subtracting the number who had died during the previous 12 months from the number who had been born. At each other year of age, the deaths at that age were subtracted from the Census figures to give an estimate of the number at the next higher age in the following year. This process was carried forward for each year and gave what may be called the 'expected' figures of population for that year. These expected figures are later to be compared with the actual figures of the 1951 Census, the differences at each age noted, and the estimates revised in the light of these differences.

The population of Canada in 1931 and 1941 by sex and age is shown graphically in the chart in the Vital Statistics Chapter.

### Section 3.—Marital Status

Next to the sex and age distribution of a population, that of marital status is probably the most fundamental. Its incidence is twofold: 'vital' and 'economic and social'.

The vital basis lies in the influence of the marriage state on the fertility of a population and, from this angle, close analyses of marital status, by age, are important. The ages of females between 15 and 45 years have more significance than those of males; if the proportion of females in this group is small, the expected proportion of births will also be small. It has been shown that for the Canadian population the combined influences of age of the population, age of the married females, and proportion of females married has become steadily more favourable to the birth rate from 1871 to 1921 but that, since the latter date, the trend has been less favourable.

#### 6.—Marital Status of the Population, 15 Years of Age or Over, by Sex, Census Years 1911-41

NOTE.—Figures for censuses previous to 1911 are not comparable.

<sup>1</sup> Includes persons who are permanently separated for domestic reasons. marital status was not stated; percentages are based on stated condition.

<sup>2</sup> Includes persons whose  
<sup>3</sup> Includes legally separated.

In Canada as a whole there are more married males than married females. Other striking statistics of marital status are the great preponderance of widows compared to widowers and the large and increasing numbers of divorced and legally separated persons.

Marital status of the 1941 population 15 years of age or over, by provinces and sex, is shown at p. 102 of the 1945 Year Book.

### Section 4.—Racial Origins

A population composed of diverse racial stocks gives rise to political, economic and social problems quite different in nature from those of one with a small admixture of foreign elements, although, to the extent that certain racial stocks are more readily assimilated than others, the problems are mitigated. It is equally true that the different educational, moral, economic, religious and political backgrounds of a people of mixed origins lend variety and diversity to the national life.

The two basic stocks of the Canadian people are the French and the English historically the French is much the older and, excepting at the time of the Census of 1921, has exceeded in numbers any one of the basic British Isles stocks.

### 7.—Racial Origins of the Population, Census Years 1921-41, with Percentage Distribution, 1941

NOTE.—Figures for the Censuses of 1871, 1881, 1901 and 1911 are given at p. 154 of the 1948-49 Year Book.

<sup>1</sup> Includes Bukovinian, Galician and Ruthenian.

<sup>2</sup> Includes 35,416 half-breeds.

Racial origins of the population by provinces and territories in 1941 are given at p. 106 of the 1945 edition of the Year Book.

## Section 5.—Religious Denominations

At each census the actual numbers attached to any religious denomination, as reported by the persons enumerated, have been recorded. The distribution of the principal denominations as at the Censuses of 1921, 1931 and 1941 is given in Table 8.

### 8.—Principal Religious Denominations of the Population, Census Years 1921-41, with Percentage Distribution 1941

NOTE.—More detailed figures for the Censuses of 1871, 1881, 1891, 1901 and 1911 are given at p. 155 of the 1948-49 Year Book.

Denomina- tion	1921	1931	1941		Denomina- tion	1921	1931	1941

<sup>1</sup> Not included in "United Church".  
Greek Catholics in 1931 and 185,657 in 1941.

<sup>2</sup> Included in United Church figures.

<sup>3</sup> Includes 186,654

Details of leading religious denominations by provinces are given at p. 109 of the 1945 edition of the Year Book; those of the populations of the nine leading cities are shown in Table 14 of the 1946 Year Book at p. 107.

## Section 6.—Countries of Birth

Table 9 gives the total population by country of birth for the census years 1921, 1931 and 1941. The census, under birthplace, collects information on both country of birth of the immigrant arrivals in Canada and the province of birth of the native-born.

### 9.—Countries of Birth of the Population, Census Years 1921-41

NOTE.—Figures for the Censuses of 1871, 1881, 1891, 1901 and 1911 are given at p. 158 of the 1948-49 Year Book.

Yugoslavia, Poland,

<sup>5</sup> Includes "birthplace not stated".

Detailed information on this subject will be found at pp. 111-117 of the 1943-44 Year Book and at pp. 156-158 of the 1948-49 edition.

## Section 7.—Citizenship

Until the Canadian Citizenship Act was passed in 1946 (the Act came into force on Jan. 1, 1947), the basic legislation governing Canadian nationality was to be found in the Immigration Act. The present legislation is outlined at pp. 000-000 Chapter V.

	22,561						

<sup>1</sup> Includes not stated.

<sup>2</sup> Includes 21,515 British-born persons who had not at the date of the census acquired Canadian domicile.

The Census of 1941 shows that less than 1 p.c. of the total Canadian-born and other British-born population had lost their Canadian citizenship through renunciation or marriage.

Over 80 p.c. of the United States-born persons in Canada, who form 2.7 p.c. of the total population, had become Canadian citizens together with 74.7 p.c. of the Continental European-born; of those born in Asiatic countries, 72.7 p.c. remained aliens. Of the total population, only 2.4 p.c. were aliens.

### **Section 8.—Languages and Mother Tongues**

Statistics under this heading for the 1941 Census are given at pp. 122-123 of the 1947 Year Book.

### **Section 9.—School Attendance**

Statistics under this heading for the 1941 Census will be found at p. 138 of the 1943-44 Year Book.

### **Section 10.—Blind and Deaf-Mutes**

Statistics regarding blind and deaf-mutes are given at p. 126 of the 1945 Year Book and in greater detail in Vol. IV of the 1941 Census.

### **Section 11.—Occupations**

Figures for Canada, excluding Yukon and the Northwest Territories, show that 3,676,563 males and 833,972 females, 14 years or over, or a total of 4,510,535 persons, including members of the Armed Forces, were gainfully occupied at the time of the 1941 Census. Males represented 81.5 p.c. and females 18.5 p.c. of the total gainfully occupied. The population of the nine provinces includes 5,890,683 males and 5,599,030 females or a total of 11,489,713 persons. The gainfully occupied, therefore, accounted for 39.3 p.c. of the total population; gainfully occupied males represented 62.4 p.c. of the total male population and gainfully occupied females 14.9 p.c. of the total female population.

Summary tables of the occupations of the Canadian people for the 1941 Census are given at pp. 1062-1073 of the 1943-44 Year Book and at pp. 160-161 of the 1948-49 edition.

### **Section 12.—Dwellings, Households and Families**

Summary data on buildings, dwellings, households and families as at the date of the 1941 Census are given at pp. 120-126 of the 1946 Year Book, pp. 126-127 of the 1947 Year Book, and pp. 161-162 of the 1948-49 edition.

**Estimates of Households and Families, 1947-48.**—The statistics on households and families in 1947 and 1948, as shown in Table 11, are derived from the data collected in conjunction with the 2 p.c. sample survey of the Labour Force for June, 1947 and 1948. It should be noted that the survey covers the total non-institutional civilian population of Canada (exclusive of Yukon and the Northwest Territories), with the exception of a small unsampled population in the northern areas of certain provinces. However, the figures in the table include estimates for the unsampled areas.

# 11.—Estimated Number of Households and Families, by Number of Persons and Average Size, and by Regions, 1941, 1947 and 1948

*Household Defined.*—A household for purposes of the sample survey is a group of people living together in the same living quarters and sharing the same house-keeping arrangements. It may be a single family, or sometimes a single person or a group of unrelated persons or, perhaps, a family with a lodger or servant making up the household.

*Family Defined.*—For purposes of comparison with the 1941 Census statistics, a family in the sample survey was defined as a group of two or more persons, living in a dwelling, related either as husband and wife, with or without children, or as parent and child. Other relatives living in the same dwelling, including married children, were not counted as members of the family. However, where a married son (or daughter) and family were living in the same dwelling or household as their parents, they were counted as a second family in the dwelling.

## Section 13.—The Census of the Prairie Provinces

The Census and Statistics Act of 1905 and the Statistics Act of 1918 (replaced by the Statistics Act, 1948) provide for a census of population and agriculture for the Provinces of Manitoba, Saskatchewan and Alberta, to be taken in 1906 and every tenth year thereafter, in addition to the nation-wide Decennial Census.

The latest Prairie Province Census was taken as of June 1, 1946, and a summary of the results available up to March, 1948, covering such general population characteristics as sex, age, marital status, birthplace, citizenship, mother tongue, years of schooling and migration, is presented at pp. 162-171 of the 1948-49 Year Book. Additional analyses, available since that date, are summarized in this edition. More detailed information may be obtained in bulletin form and will later be published in the census volumes.

The populations of the Provinces of Manitoba, Saskatchewan and Alberta as at June 1, 1946, are given in Table 12. The rural and urban classification shows that a definite trend towards urbanization has taken place since 1936. There has

been an actual decline in the rural population of Manitoba and Alberta since 1941, and in that of Saskatchewan since 1936. The 1946 figures show that this movement was accentuated by the Second World War.

### 12.—Rural and Urban Populations of the Prairie Provinces, 1906-46

Year	MANITOBA			SASKATCHEWAN			ALBERTA

1941.....	407,871	321,873	729,744	600,846	295,146	895,992	489,583	306,586	796,169
1946.....	389,592	337,331	726,923	515,928	316,760	832,688	448,934	354,396	803,330

A comparison of Table 13 with corresponding tables based on earlier censuses reveals that the proportion of the population in the older age groups has increased while the proportion in the younger age groups has decreased. This applies to all three provinces as the following percentages indicate. Population under 25 years of age in Manitoba declined from 51.4 p.c. of the total in 1931 to 44.0 p.c. in 1946; in Saskatchewan from 55.3 p.c. to 47.7 p.c.; and in Alberta from 51.7 p.c. to 46.3 p.c. Population 65 years of age or over in Manitoba increased from 4.5 p.c. of the total in 1931 to 7.3 p.c. in 1946; in Saskatchewan from 3.4 p.c. to 6.5 p.c.; and in Alberta from 3.5 p.c. to 6.3 p.c.

Summary analyses of census figures for the Prairie Provinces covering gainfully occupied, economic status of the population 14 years of age or over, occupations, earnings, employment, households, families and housing, are given at pp. 166-171 of the 1950 Year Book.

### Section 14.—Population Statistics for Newfoundland

As stated on p. 114, the following demographic statistics of Newfoundland are given separately in this edition of the Year Book to provide authentic background material for economic studies of the new province. The latest Newfoundland Census, that of 1945, took place before union and therefore, until the next federal census is taken in 1951, population data for Newfoundland cannot be combined with data for other provinces.

The population of Newfoundland including Labrador, in 1945, was 321,819, mostly the descendants of settlers from southern England and Ireland. The population is unevenly distributed, nearly one-half living on the Avalon Peninsula in the eastern part of the Island. St. John's, the capital and Newfoundland's only city, is a trading and commercial centre of about 45,000 persons within the municipality, or 57,000 persons in greater St. John's. Apart from St. John's, there are 25 places each having a population in excess of 1,000, principal among these being Corner Brook on the west coast, Bell Island and Carbonear on the Avalon Peninsula and Grand Falls, Windsor, Botwood and Bishop's Falls in the interior. The remainder of the population is distributed among more than 1,300 small settlements spread along 6,000 miles of coast line.

In Tables 14 to 22 additional information will be found on the total population of Newfoundland by sex, age, marital status, racial origin and religion. Since 98 p.c. of the population is native-born, tables on country of birth of aliens are not included. Tables 21 and 22 contain statistics on the occupations of the gainfully employed population, and dwellings and families.

<sup>1</sup> Including Labrador.

Under the terms of the House of Assembly Act, 1932 (22 Geo. V, c. 7), 24 districts (exclusive of Labrador) were set up in Newfoundland. Previous to that date there were 18 districts. Populations of the 24 districts and Labrador for 1921, 1935 and 1945 are given in Table 15.

<sup>1</sup> Includes hotel and institutional dwellings.

## PART III.—STATISTICS OF WORLD POPULATION

Population for each country or area of the world, according to the latest census and latest official estimate, is given at pp. 176-180 of the 1950 Year Book. The following table gives areas and estimates of populations of the British Commonwealth, by continents and countries.

## 1.—Areas and Populations of the Commonwealth, by Continents and Countries, 1947

NOTE.—The figures in this table are from the *United Nations Statistical Year Book, 1948*. Populations are mid-year estimates for 1947.

Continent and Country	Area	Population, 1947	Continent and Country	Area	Population, 1947

## PART I.—IMMIGRATION AND EMIGRATION

### Section 1.—Immigration\*

The history of immigration to Canada is given briefly at pp. 172-173 of the 1948-49 Year Book.

#### Subsection 1.—Legislation and Administration

**The Immigration Act and Regulations.**—Immigration to Canada is controlled by the terms of the Immigration Act and by the Regulations and Orders made under authority of the provisions of that Act. The Act is purposely flexible and does not define the classes or categories of persons admissible to Canada as immigrants. Such definitions are given in Regulations made under the Act by Order in Council. The Act does, however, define certain prohibited classes, including persons suffering from some forms of mental or physical ailment, criminals, advocates of the use of force or violence against organized government, spies, illiterates and others. Persons within these prohibited classes cannot be admitted to Canada as immigrants except by Act of Parliament.

Under the Immigration Act and Regulations, as at July 1, 1950, the categories of persons admissible to Canada as immigrants may be readily summarized. The first and most-favoured group includes British subjects from the United Kingdom of Great Britain and Northern Ireland, New Zealand, Australia and South Africa; citizens of Ireland; and native-born citizens of the United States and France entering Canada directly from those countries. Such persons are admissible if they can satisfy the immigration officers at the port of entry that they are in good physical and mental health; they are of good character; and they are not likely to become a public charge. The legal barriers against the admission of these favoured groups have been lowered as far as it is safe for any country to go in dealing with prospective residents.

\* Revised in the Immigration Branch under the direction of Laval Fortier, Deputy Minister, Department of Citizenship and Immigration.

The second general category of admissible persons consists of persons who satisfy the Minister of Citizenship and Immigration that they are suitable immigrants having regard to the climatic, social, educational, industrial, labour, or other conditions or requirements of Canada; and are not undesirable owing to their peculiar customs, habits, modes of life, methods of holding property, or because of their probable inability to become readily adapted and integrated into the life of a Canadian community and to assume the duties of Canadian citizenship within a reasonable time after their entry.

Also admissible are persons who, having entered Canada as non-immigrants, enlisted in the Canadian Armed Forces and, having served in such Forces, have been honourably discharged.

The only persons of Asiatic racial origin who are admissible to Canada are the wives and the unmarried children under 18 years of age of Canadian citizens.

**Administration.**—The responsibility for all immigration matters under the provisions of the Immigration Act rests upon the Minister of Citizenship and Immigration. The Immigration Branch, one of the four branches comprising the Department of Citizenship and Immigration, administers this Act. Headquarters of the Immigration Branch is at Ottawa.

A primary objective of administration is to assist immigrants to become quickly and satisfactorily settled in the Canadian community. In the case of group movements the Canadian Government and the International Refugee Organization both assist in preparing the immigrant for his new life prior to arrival in Canada. Upon arrival these immigrants are taken to the localities in which employment or settlement has been arranged for them and from this point they, and of course all other immigrants who come in on their own, become primarily the responsibility of the provincial rather than the federal authorities. However, through the work of the Settlement Service, Immigration Branch and the Canadian Citizenship Branch of the Department of Citizenship and Immigration and the National Employment Service of the Department of Labour, the Federal Government continues its interest in them. Liaison is maintained between the Federal Government and the provincial authorities and private organizations by the Citizenship Branch with a view to co-ordinating the efforts in this field, filling gaps and eliminating duplication.

Literature, dealing with such matters as basic English and basic French, the Canadian Government, and the acquisition of citizenship, is made available to immigrants and citizenship training classes attended by thousands of the newcomers are being conducted throughout Canada through the initiative of Provincial Departments of Education and many national organizations and societies.

*The Canadian Field Service.*—To ensure efficient administration and effective supervision, the Canadian Field Service staffs in Canada and overseas operate under the direction of the Commissioner of Immigration. The Canadian Field Service is made up of five districts—Atlantic, Eastern, Central, Western and Pacific—each under the supervision of a Superintendent. There are 293 ports of entry along the Canadian-United States border and on the Atlantic and Pacific seabords and the admissibility of every person who enters Canada is established by an Immigration Officer at one of these ports. The Canadian Field Service also includes

inland offices located at strategic points throughout the country whose staffs investigate applications for the admission of immigrants and conduct deportation proceedings.

*The Overseas Service.*—The Overseas Service functions very much along the same lines as its counterpart (the Canadian Field Service) in Canada. The offices abroad come under a Superintendent located at London, England, who reports to the Commissioner of Immigration at Ottawa, Ont. Immigration offices in the United Kingdom are located at London, Liverpool, Glasgow and Belfast. To facilitate compliance with immigration medical requirements, a roster of some 500 approved British medical practitioners makes it possible for British immigrants to undergo medical examination within a short distance of their place of residence. An immigration office is also located at Dublin, Ireland.

For the past twenty-five years, a system of preliminary examination of immigrants from Continental Europe has been in effect. This examination is intended to establish, before they embark, the admissibility of persons wishing to settle in Canada in order to avoid the hardship that would ensue from rejection at the Canadian port of entry and subsequent deportation. At present, immigration offices are in operation at Paris, Brussels, The Hague, Stockholm, Berne, Rome and Athens. In other cities on the Continent diplomatic representatives of Canada deal with immigration matters.

The immigration problem in occupied territory, namely, Germany and Austria, is a particularly difficult one. Most of the prospective immigrants to be examined are displaced persons and refugees, a large number of whom are in camps scattered all over the occupied territories and unable to proceed to examination points. Canadian Government Immigration Missions are located at Karlsruhe, Germany, and Salzburg, Austria. Itinerant immigration teams have been operating from these Missions since March, 1947. Prospective immigrants among the displaced persons are assembled and given preliminary medical examinations by the International Refugee Organization, after which they are examined by the immigration teams at the assembly points.

An X-ray examination of the chest is required for all immigrants from countries where the incidence of tuberculosis per capita is higher than it is in Canada. This excluded only citizens of the United States and New Zealand in 1949. Facilities for free X-rays are provided at the immigration offices at London, Liverpool, Glasgow, Belfast, Dublin and Paris.

The greater number of overseas immigrants come from the British Isles and the Continent of Europe, but immigrants do come to Canada from many other countries. To deal with these, immigration inspectional facilities are available at the offices of the Canadian High Commissioners in Australia, New Zealand, South Africa and India, and at Canadian Missions in Argentina, Brazil, Chile, Cuba, Japan, Mexico, Peru, Portugal and Venezuela. Immigrants from the Far East are examined at the immigration office at Hong Kong.

*Settlement Service.*—Of increasing importance in the immigration program is the work of the Settlement Service, which has staffs in all provinces of Canada and in the British Isles. The Settlement Officers in Canada locate and develop opportunities for immigrants in accordance with the needs of the areas under their supervision, enlist the co-operation of provincial and municipal authorities, and

advise voluntary organizations that take an active interest in the establishment of immigrants. It is the responsibility of Settlement Officers overseas to locate suitable immigrants to fill the needs ascertained and the opportunities developed by the Canadian section of the Settlement Service. A continuous two-way flow of up-to-date information exists between the officers of the Settlement Service in Canada and overseas.

In 1949, its first year of operation, the Settlement Service was largely instrumental in placing or establishing 5,493 families on farms or in small businesses, representing with their dependents a total of about 22,000 persons.

**Canadian Immigration Policy as at June, 1950.**—The policy in relation to immigration is to ensure the careful selection and permanent settlement in Canada of such numbers of immigrants as can be absorbed advantageously in the national economy. The figure that represents absorptive capacity will clearly vary from year to year in response to economic conditions.

*Movement of Immigrants.*—A total of 86,422 immigrants entered Canada during the fiscal year ended Mar. 31, 1950. Of these, 19,198 were from the United Kingdom, 7,660 were from the United States, and 16,662 were members of northern European races. Immigrants of all other races numbered 42,902.

From the end of the Second World War to Mar. 31, 1950, 376,921 people entered Canada as immigrants. More than 163,106 of these, or 43 p.c. of the total, were from the United Kingdom. Northern European countries and France contributed 48,804 immigrants, including 24,922 of Netherlands origin, most of whom came to Canada through the Canada-Netherlands Farm Settlement Plan; 10,651 of German racial origin; and 4,653 of French origin. Post-war immigrants from the United States numbered 40,186, and the total from all other sources was 124,825.

*Netherlands Agriculturists.*—The movement to Canada of Netherlands agriculturists which started in April, 1947, is working out very satisfactorily. Approximately 3,000 came during 1947, 7,000 during 1948, 7,000 in 1949, and 3,000 to the end of April, 1950. With few exceptions these immigrants have learned Canadian ways and farming methods and have proved to be very industrious. They have come to Canada with the main objective of becoming established on farms of their own as soon as possible. The family units are closely knit and work together, saving their money for the purchase of a farm or for the acquiring of live stock and equipment for use on rented land. Already more than 600 families have started independent farming in Canada.

The movement to Canada of these people was prompted by a number of factors, particularly the flooding of a considerable part of the Netherlands during the Second World War and the general over-population of that country, particularly of agriculturists. Immigration Branch officials, when approached by officials of the Netherlands Government in the autumn of 1946, were advised that these prospective immigrants were experienced farmers who desired to become established on farms of their own but who, in view of the restriction on the transfer of funds from the Netherlands, would be willing to accept employment on Canadian farms for a period of a year or more until they were in a position to acquire farms of their own.

In the Netherlands the movement is directed by the Netherlands Emigration Foundation. In Canada, full responsibility for the movement is assumed by the Immigration Branch, which works in close co-operation with the Agricultural Attaché of the Netherlands Embassy, Ottawa.

The movement is handled here under the nomination method, whereby applications for the Netherlands agriculturists are made by individual Canadian farmers. Each application is investigated to ensure that the applicant in Canada is a bona fide farmer. The Canadian farmer undertakes to provide employment for the Netherlands agriculturists, together with living accommodation, for a minimum period of one year. The Department of Immigration works in co-operation with a number of organizations and agencies including various departments of the Federal and Provincial Governments, the colonization departments of the Canadian Pacific Railway and the Canadian National Railways, the Christian Reformed Church, the Catholic Immigrant Aid Society, the United Church of Canada, and others.

*Displaced Persons.*—Between the first arrivals of Displaced Persons on Apr. 4, 1947, and March 31, 1950, Canada granted admission to 98,057 of these homeless people. Of this number, 55,075 were close relatives of people living in Canada and 41,700 were admitted under the group movement. The remainder were orphan children and international exchange students.

The racial distribution of Displaced Persons admitted up to Mar. 31, 1950, was:—

Polish.....	23,900	Czech <sup>1</sup> .....	1,662
Ukrainian.....	19,215	Roumanian.....	858
Hebrew.....	11,064	Bulgarian.....	125
German <sup>1</sup> .....	8,436	Albanian.....	67
Lithuanian.....	7,917	Finnish.....	60
Latvian.....	6,637	Italian.....	47
Estonian.....	4,674	Greek.....	31
Netherlands.....	4,477	Swedish.....	15
Yugoslavic <sup>1</sup> .....	4,308	Other.....	69
Magyar.....	2,276		
Russian.....	2,219	TOTALS.....	98,057

<sup>1</sup> Includes minor racial groups.

The majority of these Displaced Persons have readily found a place in our national life and are contributing materially to the economy and culture of Canada.

**Contribution of Immigrants to the Canadian Economy.**—Immigrants, in general, have been a direct cause of increased employment opportunities for Canadians through the introduction of new skills and techniques as well as managerial principles. Seventy-two industries established by refugees or immigrants from 1939 to 1947 employed, at the end of the latter year, 6,127 workers to whom they paid in that single year \$11,228,293 in salaries and wages. The gross value of the products of these industries for 1947 was \$50,720,126. The aggregate figure of salaries and wages paid by refugee industries for the period 1939-47 was \$62,797,422 and the gross value of their products, \$264,249,063. In addition, between Sept. 1, 1945, and Dec. 31, 1949, immigrants brought or transferred to Canada funds estimated by the Bank of Canada at \$168,000,000. The value of settlers' effects, the personal belongings of immigrants, brought into the country during the same period amounted to \$48,000,000.

## Subsection 2.—Immigration Statistics

Table 1 presents statistics of immigration to Canada from 1910 to 1949. For more recent years analyses, including place of last permanent residence, sex, age, birthplace, racial origin, nationality, destination and occupation, will be found in Tables 2 to 8. Table 11 deals with Canadians returning from the United States and Table 12 shows oriental immigration.

## 1.—Immigrant Arrivals, 1910-49

NOTE.—Figures for 1852-93 are given at p. 153 of the 1942 Year Book and for 1894-1909 at p. 175 of the 1948-49 edition.

Year	Arrivals	Year	Arrivals	Year	Arrivals	Year	Arrivals	Year	Arrivals

<sup>1</sup> Includes U.S.A. citizens on permit but applying for permanent residence.

**Sex, Age and Marital Status.**—Of the total immigrants 18 years of age or over entering Canada in 1949, 54 p.c. were males and 46 p.c. females. Prior to 1947, adult female immigrants outnumbered adult male immigrants almost consistently since 1931, and particularly in 1945 and 1946 when the wives of Canadian service men were coming in. Before 1931 males normally exceeded females. In 1949, adult male arrivals showed a decrease of 13,942 or 26 p.c. as compared with 1948, and adult female arrivals a decrease of 12,234 or 27 p.c.

Throughout the years, the male and female distribution of persons under 18 years of age has been fairly even. In 1949, of the 23,216 immigrants in this class, 19,809 or 85 p.c. were under 15 years, the same percentage as of the 27,237 such immigrants in 1948.

Of the total male immigrants in 1949, 40 p.c. were married and 58 p.c. single; the percentages for female immigrants were 46 and 45, respectively.

### 3.—Sex Distribution of Immigrants as Adult Males, Adult Females, and Children, 1940-49

NOTE.—Figures for 1930-39 are given at p. 183 of the 1946 Year Book.

Year	Adult Males	Adult Females	Under 18 Years		Total
			Males	Females	
	No.	No.	No.	No.	No.
1940.....	3,939	4,517	1,432	1,436	11,324
1941.....	3,851	3,489	940	1,049	9,329
1942.....	2,280	3,429	928	939	7,576
1943.....	2,113	4,064	1,177	1,150	8,504
1944.....	2,391	6,253	2,103	2,054	12,801

**Birthplace.**—British-born immigrants to Canada in 1949 decreased by 50 p.c. from the previous year and numbered 24,556 or 26 p.c. of total immigration. European immigration also decreased by 6,212 or 9 p.c. but accounted for 67 p.c. of total immigration compared with 56 p.c. in 1948.

In 1949, 20 p.c. of total immigrants were born in Poland, 9 p.c. in Italy and 7 p.c. in the Netherlands. The number of United States-born immigrants was about the same as in 1948 and accounted for about 6 p.c. of total immigration as compared with 4 p.c. in 1948.

### 5.—Birthplaces of Immigrant Arrivals, 1947-49

NOTE.—Figures for 1942-46 are given at p. 178 of the 1948-49 Year Book.

**Intended Destination and Occupation.**—Past experience has shown that not all immigrants reach the province of intended destination or follow intended occupations. Table 8 gives the intended destination as given by the immigrant for those entering Canada in 1949. Of the total immigrants, 43 p.c. were dependent wives and children, 20 p.c. were classed as farm workers, 9 p.c. as skilled workers and 10 p.c. as unskilled workers, while 7 p.c. were in the clerical, professional and merchant classes.

Of the total female immigrants, aside from dependent wives and children who accounted for 67 p.c., the largest number in any one occupational class were listed as domestic servants followed by the clerical and farming classes. Only 2 p.c. were classed as skilled workers.

<sup>1</sup> Nine months.<sup>2</sup> Includes the following classes for which totals only are given here: blacksmiths, 78; bookbinders, 12; engravers, 14; hat and cap workers, 14; harness and saddle makers, 1; jewellers, goldsmiths and silversmiths, 48; milliners, 15; patternmakers, 4; stonecutters, 8; tanners, 13; upholsterers, 34; watch and clockmakers, 61; boilermakers, 17; ironworkers, 6; moulders, 34; fishermen, 76; and not stated, 882.

**Rejections and Deportations.**—The Immigration Act provides for the rejection and deportation of immigrants belonging to prohibited classes, and also for the deportation of those who become undesirables within five years after legal entry. The results of the operation of these regulations are shown in Tables 9 and 10, which give the numbers of immigrants rejected on arrival and those deported after admission, the causes of such rejections or deportations, and the nationalities of those deported for the years 1940-49.

**Juvenile Immigration.**—Juvenile immigration, apart from children accompanying their parents, has not been a large factor since 1931, when the Federal Government ceased to grant financial assistance for this particular form of immigration. There were 33 juvenile immigrants in 1941, 23 in 1942, 28 in 1946, 6 in 1947, 28 in 1948 and 6 in 1949. An outline of juvenile immigration, including those children brought to Canada under the British Empire Settlement Agreement, is given at p. 121 of the 1941 Year Book.

**Oriental Immigration.**—The economic effect of the presence of persons of Oriental origin can best be studied from census figures. The Chinese Immigration Act was repealed on May 14, 1947. Chinese immigration has been controlled under the Immigration Act subsequent to that date. Under the present regulations, the only persons of Asiatic racial origin who are admissible to Canada are the wives and minor children of Canadian citizens.

### 12.—Oriental Immigrants, 1928-49

## Section 2.—Emigration

Emigration from Canada is an important factor tending to offset the immigration activities of the past and has attained considerable proportions at certain periods. The two main factors have been the migration to the United States of Europeans originally immigrating to Canada and the emigration of native-born Canadians.

A question of considerable interest to Canadians is that of the permanent movement of population between Canada and the United States. In view of the lack of Canadian statistics on emigration, Table 13 has been compiled from figures supplied by the Immigration and Naturalization Service of the United States Department of Justice. Not all the statistics are available by months, so that it has not been possible to present the figures on a calendar-year basis; they are, therefore, shown on that of the United States fiscal year, July 1–June 30. The column headed "Deportable Aliens Destined to Canada" covers persons permitted to return to Canada in lieu of deportation proceedings.

### 13.—Presumed Permanent Movement of Population between Canada and the United States, Years Ended June 30, 1940-49

NOTE.—Figures for 1933-34 are given at p. 168 of the 1942 Year Book; for 1935-39 at p. 184 of the 1948-49 edition.

## PART II.—CANADIAN CITIZENSHIP\*

### EARLY NATURALIZATION PROCEDURE AND EVENTS LEADING UP TO THE CANADIAN CITIZENSHIP ACT

In the years prior to 1763, aliens had no political rights in Canada because kings were so sparing of their privileges that naturalization was seldom granted. Naturalization was given as a reward for a very meritorious service or deed and only by "*lettres de nationalité*" or "*lettres de bourgeoisie*". This is the reason no law on naturalization or nationality is found in France during that period and up to the time of the cession of Canada to England.

After the cession of Canada in 1763 the inhabitants, by the fact of conquest, became British subjects and were subjected to the common law of England. By this law, which was modified and extended by later statutes (see p. 154), every person born within the Dominions of the Crown, no matter whether of British or foreign parents, and in the latter case whether the parents were settled or merely temporarily sojourning in the country, was considered British. Also, all persons being children or grandchildren of British parents, though born in a foreign State, were considered British subjects, owing their allegiance to and entitled to the protection of the Sovereign. The only exceptions were: children of foreign ambassadors (whose fathers carried their own nationality with them) and children born to foreigners during the hostile occupation of any part of the territories of England.

It is seen that, in the years since Confederation, Canada has advanced in citizenship matters from a status wherein citizenship and the right to legislate on citizenship matters was almost non-existent to a condition to-day wherein there is practically complete sovereignty in respect to Canadian citizenship and the authority to legislate thereon.

For many years before and after Confederation doubt existed as to what class of persons had become British subjects. The Act of the British Parliament 13 Geo. II, c. 7, provided for the naturalization of "foreigners who have resided or shall reside seven years or more in any of His Majesty's Colonies in America, and shall not have been absent more than two months at any one time during the said seven years, and shall take and subscribe the Oaths, and make, repeat and subscribe the Declaration appointed by 1 Geo. I, c. 13 and make and subscribe the Profession of the Christian belief, appointed by I William and Mary, c. 13, before a Judge of the Colony, and receive the Sacrament in some Protestant Congregation in Great Britain or some of the said Colonies in America, shall be deemed Your Majesty's Natural born Subjects to all intents".

Although this Act was passed before the cession of Canada to Great Britain, it later had a considerable bearing on the status of many inhabitants of Lower Canada, for since 1763 there had been a considerable immigration to Quebec of Europeans born outside the Dominions of Great Britain. People falling within this class had petitioned Lieutenant-Governor Clarke in March, 1792, asking that the doubts regarding their rights be removed. The question was referred to the British Law Officers and their opinion was that only those foreigners naturalized upon the terms of the Act quoted above or at the time of the Cession were capable of voting at the elections or of being elected members of the Assembly.

\* Prepared in the Canadian Citizenship Registration Branch under the direction of Laval Fortier, Deputy Minister, Department of Citizenship and Immigration.

Naturalization being an attribution of the Crown, that privilege was jealously guarded and authority was always denied to Colonies to pass Naturalization Acts. On June 5, 1832, however, His Majesty sanctioned an Act of Legislation of Lower Canada (I Will. IV, c. 53) passed at the solicitation of many inhabitants, real estate or office holders in the Province, confirming them in all rights and privileges of British subjects by birth, and in order to quiet any doubt as to their status as British subjects.

By the same Act the same privileges were extended to any other person actually domiciled in the Province of Lower Canada who might have been residing seven years in this or any of His Majesty's Dominions and might have held real estate. The only formality to naturalization was the taking of the Oath of Allegiance before a Clerk of the Peace in the district. This last Act appeared to be complete in that it dictated the procedure for naturalization much along the lines of the Revised Statutes of Canada, 1906, c. 77, but for the appearance before a Judge. It was the duty of the Clerk of the Peace to keep registers of the naturalization and to supply copies to the Secretary of the Province together with lists of all the names of the persons so naturalized. It provided also for the fee, the issue of copies and prosecution in cases of offences against the Act.

However, like all other Imperial Acts, it referred to a special class of persons which shows that, up to the union of Lower and Upper Canada, naturalization was granted only by special Act applicable to certain classes of people and that the procedure consisted merely in the taking of the Oath of Allegiance; the main qualification being bona fide residence in the Dominions concerned.

In England, under the common law, British nationality was acquired only by birth within the United Kingdom. It amply responded to the needs of the Saxons, owing to the isolation of the British Isles and the difficulty of relations with the exterior. After the Conquest and the beginning of territorial and commercial expansion, the relations with the continent were facilitated, immigration began and numerous children were born abroad to British subjects. It was then that the first objections were raised to naturalization by birth within the Kingdom only, as persons born abroad could not inherit, in England, the estates of their British parents. A statute, in the year 1350 (25 Edw. III, Stat. 2) granted British nationality to children born abroad to British subjects in order to enable them to inherit, but it was only in 1708 that Queen Anne (7 Anne, c. 5) gave those new British subjects all rights and privileges attached to English nationality.

Naturalization is now the modern mode of acquisition of nationality and can be traced back through the ages to the ancient times when naturalization could be attained by straight purchase. Until 1844, the kings of England granted rights and privileges of British nationality to foreigners, but only in certain circumstances and for recognized meritorious services, and those grants applied only to one person or groups of persons. It was in 1844 that the United Kingdom first passed naturalization legislation. The British North America Act confirmed the power of Canada to legislate in this matter, and the first Naturalization Act was adopted in Canada in 1870. It copied in its entirety the Imperial Act, but gave the rights and privileges to aliens within Canada only. The procedure at that time consisted of filing with the court a declaration of three years continuous residence in Canada and an Oath of Allegiance. The certificate of naturalization was granted by a judge.

On many occasions before 1915, the British Dominions discussed, at London, the question of nationality in order to come to a mutual understanding of the circumstances under which naturalization in any Dominion would be recognized in any place of the British Empire. Up to 1915, the naturalization in the United Kingdom, as well as in any of the Dominions, conferred rights and privileges of British nationality only in that part of the Empire where it was granted.

At the Inter-Colonial Conference of 1907 the Dominions insisted on a uniformity of naturalization for the whole Empire, rather than an Act which would force them to recognize as a British subject by naturalization a person who, for some reason, would never have been naturalized by them. Consequently, the United Kingdom adopted the British Nationality and Status of Aliens Act, 1914, which came into force on Jan. 1, 1915: Canada followed immediately and the other Dominions in later years.

The Naturalization Act, 1914, and its subsequent amendments, which remained in force until Dec. 31, 1946, was patterned after the British Nationality and Status of Aliens Act, 1914, the difference being in the procedure only.

The Act of 1914, commonly called the Imperial Act, conferred the status of world-wide British nationality. In effect, it removed Canada from colonial status in respect to naturalization and gave British subjects in Canada precisely the same status as that held by British subjects in other parts of the British Empire.

The foregoing action represented a major step in naturalization in Canada and resulted in 1914, in the establishment of the Naturalization Branch of the Department of the Secretary of State, at Ottawa. Prior to that time, naturalization had been administered locally by the various courts throughout Canada. These courts issued the certificates and merely filed returns half-yearly with the Department of the Secretary of State. The issue of certificates of naturalization had not been centralized at Ottawa and it was not until the passing of the Naturalization Act, 1914, that there was full federal control of the administration of naturalization in Canada.

In the course of time, and particularly after the Second World War, there was a growing feeling that Canadians should be identified officially as such. With this in mind, a Bill was drawn up in which the term "Canadian citizen" was used for the first time in relation to naturalization. This Bill, the objective of which was to create a Canadian citizenship, was approved by Parliament in 1946 and became effective by proclamation on Jan. 1, 1947. By this legislation all previous Naturalization Acts in force in Canada were repealed; this included the Canadian Nationals Act, c. 21, R.S.C. 1927. (See Section 1, pp. 155-161, for details of the Canadian Citizenship Act.)

## Section 1.—The Canadian Citizenship Act

On Jan. 1, 1947, there came into force the Canadian Citizenship Act. By this legislation all previous Naturalization Acts in force in Canada were repealed; this included the Canadian Nationals Act, c. 21, R.S.C. 1927. The purpose of the Act is to give a clear and simple definition of Canadian citizenship and to provide an underlying community of status for all the people of Canada that will help to bind them together as Canadians. Heretofore, the only definition of Canadian citizenship was to be found in the Immigration Act, and that was a limited one,

for it defined citizenship only for purposes of immigration. Now, for the first time in Canada's history, there is a clear definition of Canadian citizenship in the sense of being nationals of Canada.

An important administrative change occurred on Jan. 18, 1950, with the establishment of the Department of Citizenship and Immigration, under a separate Ministry. By this change, the administration of Canadian citizenship was transferred from the Department of the Secretary of State to the new Department of Citizenship and Immigration. This change has enabled the Citizenship Branch and the Immigration Branch to work out together many problems of mutual interest, their administrative work being so closely related. The change has had the additional effect of bringing citizenship to the status of a separate department wherein it is possible to advance materially the scientific planning of education and training in respect to the value and the importance of citizenship in Canada.

By c. 29 of the Statutes of 1950, certain amendments were made to the Canadian Citizenship Act and these amendments came into force by Proclamation on July 20, 1950. The principal purposes of the amendments are to provide for the position of children born in Canada to foreign diplomats; to expedite granting of certificates to persons who lost Canadian citizenship through marriage or otherwise; the recognition of adopted and legitimated persons; definition of the terms British subject and Commonwealth citizen; the position of the citizens of the Republic of Ireland; the continuation, under the Canadian Citizenship Act, of naturalization proceedings commenced before Jan. 1, 1947; the clarification of certain sections of the Act; and to give the Minister discretionary power in granting certificates of citizenship. The changes occasioned by these amendments will be integrated into the paragraphs that follow.

**Natural-born Canadian Citizens.**—The Canadian Citizenship Act, 1947, defines clearly the status of natural-born Canadians before and after the coming into force of the Act. It covers those persons born in and outside Canada. Provision is also made for the citizenship of a Canadian-born person born abroad, out of wedlock. Such a person is a Canadian citizen if his mother was born in Canada, or on a Canadian ship, or was a British subject with Canadian domicile, and had not become an alien. Heretofore, a person in that category had no claim to Canadian citizenship. A person born abroad of a Canadian parent before the commencement of the Canadian Citizenship Act, 1947, is not deemed to have the status of a Canadian citizen, unless he has been lawfully admitted to Canada for permanent residence, or is a minor. A person born abroad of a Canadian parent after the new Act came into force is a Canadian citizen, but there is a proviso that his birth must be registered at a Canadian consulate, or with the Minister of Citizenship and Immigration, within two years after its occurrence, or within such extended period as may be authorized in special cases by the Minister, if his parents wish him to retain Canadian citizenship. In addition, a Canadian born outside Canada, either before or after the commencement of this Act, ceases to be a Canadian citizen unless within one year after he reaches the age of 21 he files a declaration of retention of Canadian citizenship and, if he is also a citizen of a country other than Canada (dual nationality), he divests himself of such nationality by declaration of alienage or otherwise. In special cases, the Minister may extend the time during which any such person may assert his Canadian citizenship and divest himself of the other nationality or citizenship. One of the important features of the new Act, with respect to which the procedure is set out in the Regulations, is that which permits a natural-

born Canadian citizen to apply for a certificate of proof of Canadian citizenship. Many Canadians travel abroad these days and many of them reside abroad for a number of years. They, in particular, may wish to have certificates identifying them as Canadian citizens. But any Canadian, whether he intends to travel or stay at home, may apply to the Minister of Citizenship and Immigration for a certificate of Canadian citizenship and obtain one upon the payment of a fee of \$1. This is something quite new and a distinct departure from the former procedure. Under previous Acts, there was no provision for the issue of certificates of proof to Canadian citizens or British subjects, as their birth certificates were deemed to be sufficient evidence of their status.

**British Subjects, Commonwealth Citizens, Citizens of the Republic of Ireland and Canadian Citizens.**—British subjects, as distinct from Canadian citizens, have their status defined under the new Act. It should be explained that, under previous Acts, persons born or naturalized within the British Commonwealth were officially designated as British subjects. Officially, a Canadian could not describe himself as a Canadian citizen; the term was 'British subject'. This was one of the principal reasons why the Act was passed, viz., to permit a Canadian to call himself a *Canadian*. The authority for this procedure is found in Sect. 3 of the new Act, which reads:—

"Where a person is required to state or declare his national status, any person who is a Canadian citizen under this Act shall state or declare himself to be a Canadian citizen and his statement or declaration to that effect shall be a good and sufficient compliance with such requirement."

Although the designation, British subject, will be dropped in future, insofar as it applies to Canadians, this does not mean that a Canadian loses the status of a British subject or a Commonwealth citizen. Section 21 of the New Act reads that a Canadian citizen is a British subject.

The status of citizens of Ireland is set out in subsection (3) of Sect. 23 of the Act, as amended, reading as follows: "23. (3) Any law of Canada, including this Act, and any regulation made under the authority of any law of Canada shall, unless it otherwise provides, have effect in relation to a citizen of the Republic of Ireland who is not a British subject in like manner as it has effect in relation to a British subject".

It should be emphasized that the rights of non-Canadian British subjects have not been changed or infringed upon by the new Act. They will continue to have the right to vote, to obtain old age pensions, and the right of permanent entry after five years' residence in Canada. But they are not Canadian citizens until they have established a residence of five years in Canada. Those who have that residence at the commencement of the Act are Canadian citizens, and those who attain it after that date must apply for certificates of citizenship before being granted the status of Canadian citizens.

However, any British subject, whether or not he is a Canadian citizen, may apply for a certificate of citizenship. The British subject who is not a Canadian citizen may apply for a certificate direct to the Minister of Citizenship and Immigration or, alternatively, he may apply to the court of the district in which he resides. If the Minister is in any doubt as to the qualifications of the person who applies direct to him, he may refer the case to the court for consideration.

**Canadian Citizens other than Natural-born.**—Under Sect. 9 of the Act, naturalized persons and British subjects who had Canadian domicile before the commencement of this Act are Canadian citizens and may obtain a Canadian Citizenship Certificate upon payment of \$1. Sect. 9 also defines the status as Canadian citizens of women and children, other than natural-born, and the manner in which they would have acquired Canadian citizenship.

**Reinstatement of Persons of Canadian Origin Naturalized Outside of Canada.**—By the amendment of July 20, 1950, the Minister may, in his discretion, grant a certificate of citizenship to a person who was a natural-born Canadian citizen, or who was a British subject of Canadian origin, and who ceased to be a Canadian citizen or a British subject by naturalization outside of Canada, or for any reason other than marriage, if such person applies for a certificate of citizenship. The application is made direct to the Department and the qualifications are continuous residence in Canada for a period of one year immediately preceding the date of the application, and certain other general qualifications.

**Status and Procedure of Non-Canadians to Canadian Citizenship.**—In Sect. 10 (1) of the Act will be found the provisions which apply to the granting of citizenship to a person who is not a Canadian citizen. Although the word 'alien' is not used in the subsection, nevertheless its principal purpose is to define the circumstances under which an alien may apply for and be granted a certificate of citizenship. The application is made to a court, and whereas the alien *must* apply to the court, the British subject has the option of applying to the court or direct to the Minister. Furthermore, the alien must commence his application by filing a Declaration of Intention, which the British subject is not required to do.

The applicant for a certificate of citizenship may file his application at any time after his admission to Canada, and after he has attained the age of 18 years, in the form of a Declaration of Intention in the office of the clerk of the court of the district in which he resides. He must then wait not less than one year before filing with the court his application for a decision that he is qualified for citizenship. In any case, when he files his final application, he must satisfy the court that he has had a residence of one year in Canada immediately prior to the date of filing the application, and a further period of four years in Canada during the six years immediately preceding the date of the application, making a total residence of five years. In the case of an applicant who has served outside of Canada in the Armed Forces of Canada during time of war, or where the applicant is the wife of and resides in Canada with a Canadian citizen, a residence of only one year immediately preceding the date of the application is required.

In addition to the requirements of residence the applicant must satisfy the judge that he has been lawfully admitted to Canada for permanent residence; that he is of good character; that he has an adequate knowledge of English or French (knowledge of language is not necessary if he has resided continuously in Canada for more than 20 years—the 20-year clause is new); that he has an adequate knowledge of the responsibilities of Canadian citizenship, and that he intends, if his application is granted, either to reside permanently in Canada or to enter or continue in the public service of Canada or of a province thereof.

When the judge has given his decision, the papers and the decision are forwarded to the Minister of Citizenship and Immigration. He may, in his discretion, grant a certificate of citizenship. When a certificate is granted, it is forwarded to

the Clerk of the Court, who then notifies the applicant to appear in court for the purpose of taking the Oath of Allegiance and Declaration of Renunciation of Foreign Allegiance and receiving his certificate of citizenship.

**Status of Married Women.**—One of the important changes in the new Act is the citizenship emancipation of married women. Hitherto, an alien woman marrying a British subject became a British subject. Contrariwise, a woman of British nationality who married an alien, and acquired his nationality upon marriage, ceased to be a British subject. In fact, prior to 1932, a woman of British nationality who married an alien lost British nationality regardless of whether or not she acquired her husband's nationality. Under the new law all this is changed. A Canadian woman does not lose Canadian citizenship upon marriage to an alien, and an alien woman who marries a Canadian does not, by reason of the marriage, become a Canadian citizen. In the former case, if she has acquired her husband's nationality, the married woman may divest herself of Canadian citizenship by filing with the Minister of Citizenship and Immigration a declaration of alienage and she shall thereupon cease to be a Canadian citizen. In the latter case, an alien woman must apply to the court for a certificate of citizenship. The only concession is that a residence of only one year in Canada is required.

In the past, married women were classed with minors, lunatics and idiots as persons under disability. They could not become naturalized or control their national status as independent persons, except in very special circumstances. These disabilities have been removed and under the new Act married women have equal status with men.

**Status of Minors, Foundlings, Posthumous Births, etc.**—Under Sect. 10 (5) of the Act, a certificate of citizenship may be granted to a minor child of a person to whom a certificate of citizenship is, or has been, granted under the Act on the application of that person if the person is the responsible parent of the child, if the child was born before the date of the grant of the certificate and has been lawfully admitted to Canada for permanent residence. Under Sect. 11 (3), the Minister may, in his discretion, grant a certificate to a minor in any special case whether or not the conditions of the Act have been complied with. For the first time, a Canadian Act on nationality or citizenship defines the status of a deserted infant; under previous Acts there was no mention of the status of a deserted child. Under the new Act, it is provided that every foundling, who is or was first found as a deserted infant in Canada, shall, until the contrary is proved, be deemed to have been born in Canada. Another new provision in the Act is the case of a child born after the death of his father. For purposes of definition of natural-born Canadian citizens, the child shall be deemed to have been born immediately before the death of the father.

**Children of Diplomatic Representatives in Canada.**—By the amendment of July 20, 1950, there is a new provision, Sect. 2, ss. (2), which excludes from the status of natural-born Canadian citizens the children born in Canada of parents who are the diplomatic or consular representatives of foreign countries in Canada, or who are employees in the service of these representatives. It was proposed that it would not be appropriate to permit children who come within this category to be designated as Canadians by birth. The effective date of this amendment is Jan. 1, 1947.

**Adopted or Legitimated Children.**—Another new departure in Canadian Legislation, effective July 20, 1950, is the amendment, Sect. 11 (2), under the terms of which certificates of Canadian citizenship may be granted to adopted or legitimated children if the adopter, or the legally recognized father, is a Canadian citizen.

Under Sect. 11 (1) of the Act, a certificate may be granted for the purpose of removing any doubts as to whether the person to whom it is granted is a Canadian citizen, and it is specifically provided that the granting of the certificate shall not be deemed to establish that the person to whom it is granted was not previously a Canadian citizen.

**Protection of Status Prior to the Canadian Citizenship Act.**—Sect. 44 of the Act provides that notwithstanding the repeal of the Naturalization Act and the Canadian Nationals Act, the Canadian Citizenship Act is not to be construed or interpreted as depriving any person who is a Canadian national, a British subject or an alien as defined in the said Acts, or in any other law in force in Canada, of the national status he possesses at the time of the coming into force of this Act.

**Loss of Canadian Citizenship.**—A Canadian citizen who, when outside of Canada and not under a disability, by any voluntary and formal act, other than marriage, acquires the nationality or citizenship of a country, other than Canada, shall cease to be a Canadian citizen. This is the usual way in which Canadian citizenship is lost. This does not apply, however, where the nationality or citizenship acquired is that of a country at war with Canada at the time of the acquisition but, in such a case, the Minister may, in his discretion, order that the Canadian citizen shall cease to be a Canadian citizen either at the date of the said acquisition or at the date of the Order as the Minister may therein direct.

A Canadian citizen who, when in Canada, acquires the nationality or citizenship of a foreign country by any voluntary and formal act, other than marriage, shall cease to be a Canadian citizen, in the discretion of the Governor in Council upon report from the Minister. This is an amendment to the Canadian Citizenship Act which came into force on July 20, 1950. There are other causes, such as service in the Armed Forces of a country when it is at war with Canada; a minor child who acquires a foreign citizenship with his responsible parent; or a woman who acquires her alien husband's nationality and files a declaration of alienage. The minor child who loses Canadian citizenship through his parent, may, within one year of attaining his twenty-first year, file a declaration of retention of Canadian citizenship, and he shall, thereupon, again become a Canadian citizen.

A Canadian citizen, other than natural-born or one who has served in the Armed Forces of Canada in time of war, ceases to be a Canadian citizen after a residence of at least six consecutive years outside Canada, except in specific cases wherein the principle of maintenance of some connection with Canada is proved. There is authority, however, to extend the period of residence outside Canada for more than six years, by registration with an officer duly authorized under the regulations and the issue of a certificate of extension.

**Revocation of Citizenship.**—The revocation procedure which obtained under the Naturalization Act has been carried forward into the new Act. This provides for the establishment of a revocation Commission to inquire into and report upon

the proposed revocation of certificates of citizenship. Revocation can take place only by Order of the Governor in Council, upon recommendation of the Minister of Citizenship and Immigration. Revocation proceedings may be instituted on the grounds of residence outside of Canada for not less than six years; trading with the enemy during time of war; false representation or fraud, or the concealment of material circumstances at the time of naturalization; disaffection or disloyalty to His Majesty, while out of Canada or, if in Canada, the naturalized citizen has been convicted of treason or sedition by a competent court.

**The Oath of Allegiance.**—In conformity with the new conception of Canadian citizenship as defined in the Act, the form of Oath of Allegiance has been changed. Under the Naturalization Act it read as follows:—

"I (AB) swear by Almighty God that I will be faithful and bear true allegiance to His Majesty King George the Sixth, his Heirs and Successors, according to law. So help me God."

Under the new Act, the Oath has been altered to read:—

"I (AB) swear that I will be faithful and bear true allegiance to His Majesty King George the Sixth, his Heirs and Successors, according to law, and that I will faithfully observe the laws of Canada and fulfil my duties as a Canadian citizen. So help me God."

**Canadian Citizenship Ceremonies.**—One of the significant innovations in the new Act is the ceremonies attendant upon the presentation of certificates of citizenship at special sittings of the courts. Machinery has been set up by which the courts across the country will be given every assistance possible in the arrangement of ceremonies in connection with the presentation of certificates of citizenship.

It is planned, also, to provide the newcomer to Canada with special facilities for training and education in the fundamentals of citizenship and a manual on Canadian citizenship will be issued to the alien when he files his Declaration of Intention.

*(A summary of this Act is given at pp. 1178-1184 of the 1948-49 Year Book.)*

**The Canadian Citizenship Branch.**—The Canadian Citizenship Branch of the Department of Citizenship and Immigration is responsible for the co-ordination of citizenship training undertaken by provincial Departments of Education, national organizations or private societies throughout Canada; the encouragement of foreign-language organizations and other societies in their efforts to aid the newcomer; and the provision of basic training materials for the use of all agencies establishing citizenship training classes.

In order to carry out these functions, the Canadian Citizenship Branch has been organized into three divisions, each administered by a Director and an Assistant Director—the Liaison Division, the Information Division and the Research Division.

## Section 2.—Canadian Citizenship Statistics

Tables 1 and 2 show the number of citizenship certificates granted in each year since the Canadian Citizenship Act came into force and the nationality of the recipients of these certificates.

### 1.—Citizenship Certificates Granted to Canadian-Born and Other British-Born Citizens, 1947-49

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

## Section 1.—Collection of Vital Statistics

The history of the collection of vital statistics in Canada is covered broadly at pp. 185-188 of the 1948-49 edition of the Year Book.

A review of the collection of vital statistics in Newfoundland prior to union with Canada is presented at pp. 197-198 of the 1950 Year Book. The principal vital statistics for Newfoundland before union are given in Section 10 of this Chapter pending incorporation with the statistics for the other provinces.

**Classification of Vital Statistics.**—Until 1944 vital statistics were all classified by place of occurrence. In that year, however, the classification of births and deaths by residence was begun, births being classified by the residence of the mother. A number of special tabulations by residence have been made for a few years prior to 1944; in Tables 1 to 4 and in Tables 11, 12, 13, 23, 24 and 35 the figures are shown for the five-year average 1941-45. Marriages, on the other hand, are classified by place of occurrence.

## Section 2.—Summary of Vital Statistics

Tables 1 to 6 give a summary of the vital statistics of Canada and the provinces for the years 1941 to 1948.

In comparing the birth, death and marriage rates of the provinces, it is useful to bear in mind that part of the differences observed may be due to differences in the sex and age distribution of their populations. Similarly, changes in these rates may be due partly to changes in this distribution. These remarks also apply to international comparisons of birth, death and marriage rates. Over the past 15 years, the death rate in British Columbia has been rising, while in Ontario it has been more or less stable, with the result that, though 15 years ago the death rate in Ontario was considerably higher than in British Columbia, at present their rates

\* Revised in the Health and Welfare Division, Vital Statistics Section, Dominion Bureau of Statistics.

are about equal. This does not mean, however, that the mortality rates at each age have risen in British Columbia. On the contrary, they have been falling. The death rate for the population as a whole has been rising because the increasing proportion of population in the higher age groups has more than outweighed the fall in the mortality rates at each age.

### Section 3.—Canadian Life Tables

Two official life tables for Canada and regions have been published, the first having been calculated on the basis of the deaths of 1930-32 and the census population of 1931; the second on the basis of the deaths of 1940-42 and the census population of 1941. In addition, tables have been computed for Canada as a whole for the years 1945 and 1947 based on estimated populations by sex and age and the deaths recorded as having occurred during those years. The life table for 1947 is given in abbreviated form in Table 7.

Life tables give a summary of the health and general conditions of survival of the population in a conventional, standard form. A hypothetical number (100,000) of births of each sex is assumed. The life tables show how, on the basis of the mortality rates at each age in the given years, these 100,000 of each sex are reduced in number by death. For example, during the year 1947, of 100,000 males born, 5,198 died in their first year, so that 94,802 survived to one year of age; 408 died in their second year, so that 94,394 survived to two years of age; and so on. At 100 years of age, only 56 of the original 100,000 would have survived. The probability of death at each age is the ratio between the number of deaths and the population at each age. Finally, the expectation of life is the average number of years which a person might expect to live if the mortality rates in the given years remained constant.

7.—Canadian Life Table, 1947

Age	Males				Females			
	Number Living at Each Age	Number Dying Between Each Age and the Next	Proba-bility of Dying at Each Age	Expecta-tion of Life	Number Living at Each Age	Number Dying Between Each Age and the Next	Proba-bility of Dying at Each Age	Expecta-tion of Life

		56				80		

Mortality rates for males are higher at all ages than for females, particularly in infancy. Infant mortality in 1940-42 was 62 per 1,000 live births for males compared to 49 per 1,000 for females. Because infant mortality is still so high, the expectation of life at birth is less for both sexes than at age 1. In 1947 males who had survived their first year had an expectation of life of almost 68 years and females of almost 71 years. The expectation of life of a boy at age 15 was 55 years, and of a girl 58 years. At age 25, it was about 46 years for men and almost 49 for women. At age 70, when people become eligible for old age pensions, it was 10·4 years for men and 11·4 years for women.

Table 8 summarizes the life expectancy figures for 1931, 1941 and 1947. During this period, life expectancy at birth has increased from 60 to over 65 years for males and from 62 to 69 years for females. The greatest increases have been among the

younger ages for both sexes but have been appreciably higher among females than among males and for females have extended into the older ages. There has been little or no appreciable increase between 1931 and 1947 in life expectancy among males over 40, whereas for females the rates have increased at all ages up to 80. Increases in life expectation among women of child-bearing age is worthy of note.

### 8.—Expectation of Life, 1931, 1941 and 1947

<sup>1</sup> Excluding infants born alive but who die before registration of birth.

**Canadian Births.**—In Canada, in 1921, the birth rate was 29 per 1,000. Since a rate of 35 per 1,000 is very high for countries of modern western civilization, the Canadian birth rate had probably not fallen far or for long before then. It fell continuously until 1937, when it was 20 per 1,000 but since then, owing to economic recovery and the War, it rose to 22 in 1940, to 24 in 1943 and to 27 in 1948. The birth rates in the provinces followed the same general trend, though in the Maritimes the fall stopped before 1930.

**Sex of Live Births.**—Wherever birth statistics have been collected, they have shown an excess of male over female births. No conclusive explanation of this excess has yet been given. Nevertheless it is so much of an accepted statistical fact that a proper ratio of male to female births has become one of the criteria of complete registration. The number of males to every 1,000 females born in Canada in 1941-48 varied between 1,067 and 1,051.

Hospitalization and medical attendance at birth have increased in Canada. In 1926-30, only 22 p.c. of live births occurred in hospitals, while in 1940-42 the proportion was 50 p.c. and in 1948, 72 p.c. The provinces still differ greatly in this respect. In 1948 the proportions of births that occurred in hospitals were: Quebec 41 p.c., New Brunswick 64 p.c., Prince Edward Island 76 p.c., Nova Scotia 80 p.c., Ontario 88 p.c., Manitoba 89 p.c., Saskatchewan 92 p.c., Alberta 95 p.c., and British Columbia 96 p.c.

**Illegitimacy.**—Less than 5 p.c. of live births in Canada are illegitimate. This percentage is comparatively low. The percentage in the five-year period 1926-30 was 3 and in 1941-45 it was just over 4. The apparent increase is partly due to the more complete registration of illegitimate births, brought about in large measure by the co-operation of provincial registration officials and social welfare agencies.

**Stillbirths.**—The rate of stillbirths has been falling since 1926, though not equally in all provinces. The rate of illegitimate stillbirths per 1,000 illegitimate live births is considerably higher than the rate of legitimate stillbirths, and consequently higher than the over-all rate.

**Multiple Births.**—Approximately one confinement in 85 in Canada results in the birth of more than one child. In the period 1926-48 there have been 69,489 such confinements, of which 68,849 were twins and 631 were triplets. There have been eight sets of quadruplets. The Dionne quintuplets were born in 1934.

The proportion of stillbirths is higher among multiple than among single births. It is about twice as high for twins and between three and five times as high for triplets.

**Fertility Rates.**—The sex and age distribution of the population is an important factor in determining birth, death and marriage rates. Since more than 95 p.c. of children are born to women between the ages of 15 and 50, differences in the proportion of women of these ages to the population as a whole will cause differences in the birth rates of different countries or regions, even though the fertility of women at each age may be the same. Measures of fertility which are independent of the sex and age distribution of the population have, therefore, been devised. The best known of these are age-specific fertility rates and reproduction rates.

Further details on this subject may be found at pp. 153-154 of the 1947 edition of the Year Book or from the report "Gross and Net Reproduction Rates, Canada and the Provinces", published by the Dominion Bureau of Statistics, Ottawa.

**Ages of Parents.**—The numerical and percentage distribution of legitimate live births by the ages of the parents is given in Table 15, of illegitimate live births by the age of the mother in Table 16, and of stillbirths by the age of the mother in Table 17. The average ages of the parents are also given.

In 1930-32 the average age of fathers was 33·7 years and of mothers 29·3 years. The average age of parents is now slightly lower. Besides the fertility rates at each age, two other factors help to determine the average age of parents having children: first, the average age of potential parents, that is, of the population between the ages of 15 and 50 and secondly, the proportions of first and second births to the total. The average age of men between 15 and 50 was 30·9 years in 1931 and 30·7 in 1941; the average age of women was 30·4 in 1931 and again 30·4 in 1941. The changes are thus very small. Other things being equal, a high proportion of first and second births will result in a lower average age of parents. In 1930-32 first and second births were 43 p.c. of the total births. In 1945-48 first and second births together were 57 p.c. of the total. These changes are very great and account for the lower average age of parents.

A number of other facts are shown in Tables 15, 16, and 17. In the first place, the average age of fathers of legitimate children is about four years greater than the average age of mothers. Secondly, the average age of mothers of illegitimate children is four to five years less than the average age of mothers of legitimate children; in 1930-32 the difference was six years. The fact that over two-thirds of illegitimate children are born to mothers under 25 years of age accounts for this difference. Thirdly, the average age of mothers of stillborn children is higher than that of live born. Table 17 shows that the rate of stillbirths per 1,000 live births increases with age of the mother. It is more than twice as high among mothers of 40-44 years as it is among mothers of 20-24, and over three times as high among mothers of 45-49.

**Order of Birth.**—Tables 17 and 18 show the order of birth of legitimate and illegitimate live-born children according to the age of the mother. In 1948 the proportion of first-born children was 30 p.c. of legitimate live births and 68 p.c. of illegitimate live births.

**Birthplaces of Parents.**—Table 20 shows the numbers and percentages of children whose parents were born in Canada and other countries. The proportion of children born to British-born and to foreign-born parents is decreasing. This is the result of the smaller immigration of recent years.

**20.—Live Births, by Nativity of Parents, 1945-48**

Country of Birth of Parents and Year	Numbers			Percentages		
	Father	Mother	Both Parents	Father	Mother	Both Parents

1948	12,425	9,127	3,408	3.6	2.6	1.0
Unspecified..... 1945	13,095	614	34	4.5	0.2	--
1946	13,729	508	15	4.2	0.2	--
1947	14,663	542	21	4.1	0.2	--
1948	15,185	576	27	4.4	0.2	--
<b>Totals..... 1945</b>	<b>288,730</b>	<b>288,730</b>	<b>234,089<sup>1</sup></b>	<b>100.0</b>	<b>100.0</b>	<b>81.1<sup>1</sup></b>
1946	330,732	330,732	266,805 <sup>1</sup>	100.0	100.0	80.7 <sup>1</sup>
1947	359,094	359,094	285,471 <sup>1</sup>	100.0	100.0	79.5 <sup>1</sup>
1948	347,307	347,307	281,071 <sup>1</sup>	100.0	100.0	80.9 <sup>1</sup>

<sup>1</sup> These figures or percentages are of the children whose fathers and mothers were born in the same country. The difference between this figure and the total number of births represents the number of children whose parents were born in different countries.

**Racial or Ethnic Origins of Parents.**—A person's origin is usually traced through the father. For example, if the father is English and the mother French, the person's origin is said to be English. Illegitimate children, however, are usually classified by the origin of their mother, since the particulars of the father are seldom known.

Table 21 shows that about 60 p.c. of Canadian children are born to parents who are of the same racial or ethnic origin.

## Section 5.—Deaths

Except for wars and their after-effects—military and civilian deaths in the First and Second World Wars must be counted in tens of millions—impressive declines in the death rate have been recorded during the past century in many countries of the world.

## Subsection 1.—General Mortality

**International Comparisons.**—A comparison of the death rates in Canada and the provinces with those of other countries is shown in Table 22.

## 22.—Death Rates per 1,000 Population of various Countries of the World compared with Canada and the Provinces for Recent Years

<sup>1</sup> Excluding infants born alive but who die before registration of birth.

**Canadian Mortality.**—Since 1931, the Canadian death rate has fluctuated between 10·3 and 9·3 per 1,000. It has been more or less stable in Ontario, has been falling in the Maritimes and Quebec and has been rising slightly in the Prairie Provinces and British Columbia. The generally low rates in the Prairie Provinces are partly due to their younger average population and the slow rise in these provinces during the last few years is due to the increasing proportion of people in the older age groups.

Throughout Table 23, with one exception (Prince Edward Island death rates for 1945 and 1948) the death rates are higher for males than for females.

**Deaths in Urban Centres.**—In Table 24 deaths are classified by place of residence. The death rates in urban centres vary only slightly from the death rates of their respective provinces. However, due to the influx of young people from the rural areas, the age distribution of the population in urban centres is often more favourable to a low death rate than that of the province as a whole.

<sup>1</sup> As at the 1941 Census.

**Sex and Age Distribution of Deaths.**—Despite reductions in infant mortality, more deaths still occur in the first year of life than in any other year. The number of children dying under five years of age was reduced from an average of 25,174 in 1930-32 to 17,949 in 1940-42. In 1948 the number was 17,899.

The percentage distribution of deaths has changed greatly since 1930-32. The percentages of deaths at all ages up to 50 years have declined, and the percentages at ages over 50 have increased. The average age at death has gradually risen. The reduction in mortality rates in the early and middle years of life increases the number of people in the older age groups and raises the average age of the population as a whole. In 1931, 16.6 p.c. of the population was 50 years of age or over and the average age of all males was 29.0 years and of all females 28.1 years. In 1941, 19.7 p.c. of the population was 50 years of age or over, and the average age of all males had risen to 30.7 years and of all females to 30.2 years. Compared with most European countries, however, the population of Canada is still young. The average age of death for males in 1948 was 54.6 years and for females 56.8 years.

**Causes of Death.**—About 91 p.c. of the deaths in Canada are due to the 28 specified causes given in Table 26. About 80 p.c. are due to ten causes: diseases of the heart, cancer, intracranial lesions, violent deaths, nephritis, diseases of early infancy, pneumonia, tuberculosis, influenza and diseases of the arteries.

The rise in the average age at death has been noted at p. 178. Causes of death that affect children and young adults mainly have declined. Diphtheria, for example, has been almost wiped out and tuberculosis has been greatly reduced. On the other hand, the ageing of the population increases the proportion of deaths from the causes that affect older people mainly. Thus, cancer, nephritis and diseases of the heart now account for a substantially larger proportion of all deaths than formerly.

<sup>1</sup> 1938 (5th) Revision of the International List of Causes of Death.

### Subsection 2.—Infant Mortality

**International Comparisons.**—New Zealand for many years has had the lowest rate of infant mortality. In 1948 the rate was 22 per 1,000 live births, compared with 68 in 1905, 51 in 1920 and 34 in 1930. Iceland also had a rate of 22 per 1,000 in 1947. In England and Wales the rate declined from 128 per 1,000 in 1905 to 60 in 1930 and 34 in 1948. In the United States the rate was reduced

from 162 in 1900 to 47 in 1940 and 32 in 1948. The energy devoted in recent years to reducing infant mortality has resulted in definite improvement in many other countries.

**27.—Infant Mortality per 1,000 Live Births in Various Countries of the World compared with Canada and the Provinces for Recent Years**

<sup>1</sup> Excluding infants born alive but who die before registration of birth.

**Canadian Infant Mortality.**—A striking improvement has been shown in the rate of infant mortality during the past 25 years. Of the children born in 1944-48, approximately 72,000 lived to their first birthday who would have died at the rate prevailing in the period 1926-30.

Infant mortality of males is 25 to 30 p.c. higher than that of females. It was pointed out earlier that there were between 1,051 and 1,067 males born to every 1,000 females. Because male infant mortality is higher, the excess of males is much less at the end of the first year. For example, in 1940-42, 397,038 male children were born, compared with 374,908 female children, an excess of 22,130 or 5.9 p.c.; 25,024 male children died during their first year compared with 18,646 female children, that is 6,378 more. The excess of males at one year of age is thus reduced to 15,752, or 4.4 p.c. By the age of 52, according to the life table on p. 167, the numbers of males and females will have become equal.

Infant mortality rates vary considerably from province to province. One of the principal causes of these variations appears to be the different proportions of births which take place in hospitals or under proper medical care. Examples of these differences have been given earlier, see p. 169. Along with increased hospitalization has come better and more widespread pre-natal and post-natal care. Other factors, particularly the supervision of water supplies, improved sanitation and the pasteurization of milk, also have been important.

**Infant Mortality in Urban Centres.**—Infant mortality rates in individual cities and towns usually vary widely from year to year. As is evident from Table 29 many cities and towns have, however, maintained consistently low rates.

**Causes of Infant Deaths.**—Of the infant deaths that occur in Canada, about 90 p.c. are due to the nine causes and groups of causes specified in Table 30. One cause, premature birth, accounts for over 25 p.c. The rates from nearly all causes are higher for male than for female children.

**Subsection 3.—Maternal Mortality**

As in the case of infant mortality, the number of mothers who die in pregnancy and childbirth has been greatly reduced. Maternal mortality in Canada and the provinces is shown in Table 5, p. 165. Although the number of births has been much greater in recent years, the number of maternal deaths has been well below a thousand a year. The rate of maternal mortality is now less than 2 per 1,000 live births. Mortality among unmarried mothers is much higher than among married mothers.

**Age at Death.**—Table 31 shows the distribution of maternal deaths by age, together with the average age at death. The latter is slightly more than two years higher than the average age of all mothers at the time of childbirth. The rates per 1,000 live births by age groups show that age is a most important factor in maternal mortality. Though all the rates are much lower than they used to be, the inequalities between the age groups remain. The rate at 30-34 years is nearly twice as high as the rate at 20-24 years, and above the age of 40 it is over four times

as high. The slightly higher rate in the first age group shown in the table, compared with the second, is due to the high proportion of illegitimate children born to young mothers.

**Causes of Maternal Deaths.**—Table 32 shows, by causes, the numbers and rates of maternal deaths per 100,000 live births. Until recently, puerperal sepsis and toxæmias of pregnancy were by far the most important causes. Since the introduction of sulpha drugs in 1936, the rates from these two causes have decreased by 50 p.c.

## Section 6.—Communicable Diseases

The national reporting of communicable diseases in Canada was undertaken in 1933 by the Dominion Bureau of Statistics, at the request of the Federal Department of Pensions and National Health in co-operation with the Provincial Departments of Health. Since then, the Vital Statistics Section of the Bureau has been responsible for the weekly compilation and analysis of communicable diseases except for a short period during 1939-40, when the work was transferred to the Department of Pensions and National Health. The reports of cases of venereal diseases are included in the current analyses and a standard report form is used by all the provinces.

Table 33 shows the number of cases of certain communicable diseases reported to the Dominion Bureau of Statistics by the Provincial Departments of Health in 1948. The reporting of two diseases, dysentery and rubella, is not compulsory in all provinces and the totals for Canada should, therefore, be accepted with reservations.

## Section 7.—Natural Increase

In 1926-30 the rate of natural increase in Canada (excess of births over deaths) was 13 per 1,000 population. Owing partly to the depression, the birth rate declined more than the death rate and the rate of natural increase fell to 9.7 in 1937. Since then the rate has increased to 12.6 in 1940-42, 14.5 in 1945, 17.5 in 1946, 19.2 in 1947 and 17.7 in 1948.

The rates of natural increase in the provinces followed generally the rate for Canada as a whole. In earlier years, Saskatchewan and Quebec had the highest rates. The high rates in all the Prairie Provinces were due partly to their

relatively younger populations and consequent very low death rates. In Quebec, on the other hand, the death rate in 1926-30 was high; it has declined steadily since. In 1948, New Brunswick had the highest rate of natural increase in Canada.

The rates are generally higher for females than for males for the reason that death rates for males is higher than for females. Also, in the case of the Western Provinces, the ratio of males to females in the population, upon which the birth rates are based, are relatively higher than the ratio of male to female births—hence the birth rates for males are lower than for females.

In a country such as Canada with a fairly young population and in which immigration has been large, an excess of males is to be expected. The higher rate of natural increase for females will gradually reduce this excess. Eventually there will, no doubt, be an excess of females in the total population as there now is in most European countries.

### 34.—Natural Increase and Rates of Natural Increase, by Sex and by Provinces, 1945-48

**Natural Increase in Urban Centres.**—The classification of births and deaths by place of residence makes it possible to calculate rates of natural increase for urban centres; the figures are given in Table 35. In most of the larger cities the rate is lower than for their respective provinces.

Nova Scotia.....	1948	8.0	Jamaica.....	1947	4.5
Prince Edward Island.....	1948	6.8	El Salvador.....	1947	3.5
Denmark.....	1948	9.4			

As a rule, marriage rates vary with the level of economic prosperity. They fell during the depression years following 1929, but recovered in the later 1930's. In Canada, England and the United States, the number of marriages was exceptionally high in 1940-42, decreased in 1943 and 1944 but increased in 1945 and 1946. In Canada there were 20 p.c. fewer marriages in 1944 than in 1942. In 1945 there were 7 p.c. more marriages than in 1944 and in 1946 the number was 5 p.c. more than in 1942, the previous high year. The number decreased in 1947 and 1948.

**Canadian Marriages.**—Table 37 shows the number of marriages and the marriage rates per 1,000 population in Canada and the provinces. Percentages of brides and bridegrooms according to place of birth are also given.

The proportion of brides and bridegrooms born in Canada is increasing. The average in 1941-45 was more than 10 p.c. greater than in 1931-35. In the Western Provinces, over one-third of the marriages solemnized in 1931-35 were between persons born outside Canada. In 1941-45, taking Canada as a whole, approximately 88 p.c. of all bridegrooms and 92 p.c. of all brides were born in Canada. In the Western Provinces the proportions were 76 p.c. and 86 p.c., respectively. The higher proportion of marriages between persons born in Canada was due to the restricted immigration of recent years. A slight increase was shown in the number of grooms and a decrease in the number of brides born outside Canada in 1948 compared with 1947.

**Age and Marital Status of Bridegrooms and Brides.**—Over 90 p.c. of the marriages in 1948 were between persons who had not previously been married. The average age at marriage of bachelors is about 27 years and that of spinsters about 24 years. The average age of widowers and widows at the time of re-marriage is more than 20 years higher than that of bachelors and spinsters, being 50.3 years in 1940-42 and 52.5 in 1948 for widowers and 46.4 and 45.6, respectively, for widows. The age distribution of widowers and widows at the time of re-marriage is, of course, very different from that of bachelors and spinsters.

Widowers and widows were each 5 p.c., of all bridegrooms and brides in 1948, compared with 4 and 3 p.c., respectively, in 1940-42. Marriages of divorced persons made up 4 p.c. of the total in 1948.

**Religious Denominations of Brides and Bridegrooms.**—The distribution of brides and bridegrooms by religious denominations is roughly the same as that for the population as a whole. Table 40 shows the very strong influence that religion has on marriage. Approximately 70 p.c. of all marriages are between persons of the same religious denomination; among those of Jewish faith, it was 95 p.c. in 1948; among Roman Catholics 89 p.c.; United Church 61 p.c.; and Eastern Orthodox 59 p.c.

### Subsection 2.—Dissolutions of Marriage (Divorces)

For many years after Confederation, the number of divorces in Canada was very small. It was less than 20 in every year before 1900. There were 23 divorces in 1903, 51 in 1909 and 60 in 1913. These numbers were less than 1 per 1,000 of the yearly number of marriages.

One effect of the First World War was to increase the number of divorces. The generally unsettled conditions and the long separation between men on Active Service and their wives contributed to this increase. Changes in law and procedure which made it easier to obtain divorce was a further factor. At present, Quebec is the only province in which applicants for divorce must secure a private Act of Parliament.

There were 114 divorces in Canada in 1918 and 608 in 1926; the number had increased to 700 by 1931, 1,570 by 1936 and 2,369 by 1940. Each year from 1940-47 the number was higher than the year before but 1948 showed a decrease of 16.1 p.c. from 1947. The figures, generally, cover only final decrees of dissolution of marriage which alone constitute divorces; annulments and legal separations are excluded.

<sup>1</sup> A Divorce Court was established in Prince Edward Island in 1945 and figures for 1946, 1947 and 1948 are shown in the third column.

<sup>2</sup> By a new rule adopted in August, 1948, a Decree Nisi becomes absolute at the end of three months. As a result, a number of divorces will not become effective until the following year.

## Section 9.—Vital Statistics of Yukon and the Northwest Territories

The vital statistics of Yukon and the Northwest Territories have been collected since 1924. These statistics are not presented with those of the nine provinces in the tables of this Chapter, because the figures are not considered complete in that the personal particulars in many cases are not available, and the small and varying population of each year is not accurately known.

### 42.—Vital Statistics of Yukon and the Northwest Territories, 1941-48, with Five-Year Averages, 1926-40

### Section 10.—Vital Statistics of Newfoundland, 1937-48

A summary of vital statistics for Newfoundland, prior to union with Canada, is presented in Tables 43 and 44. These figures are taken from the reports of the Registrar General of Newfoundland. When figures for 1949 are available, the vital statistics for Newfoundland will be included with the provincial totals.

A review of the collection of vital statistics in Newfoundland prior to union is given at pp. 197-198 of the 1950 Year Book.

### 43.—Live Births, Deaths, Natural Increase and Marriages in Newfoundland, 1937-48

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

The major responsibility for public health and welfare in Canada has rested with the Provinces, but the fiscal capacity of these Governments has not always been sufficient to meet the demands for either improved or new social legislation. On the other hand, the Federal Government, which occupies a much stronger financial position than do provincial and local governments, has faced certain constitutional limitations with regard to social security measures. In order to circumvent these difficulties in the furtherance of social legislation three different approaches have been used. In the case of unemployment insurance an amendment to the British North America Act was obtained, placing this field of activity under federal jurisdiction. In the field of benefits to the blind and to the aged, a joint federal-provincial pension program was established. The plan is administered provincially and federal financial assistance is provided through grants-in-aid representing 75 p.c. of the pension. Similarly, in the area of public health, financial aid is being extended through several federal health grants for the strengthening of provincial health services. Federal aid has also been made available in 1950 to assist the Provinces of British Columbia, Manitoba and Quebec in meeting losses caused by flood and fire. Family allowances, a federal non-contributory program, illustrates a third approach to social legislation.

In addition, the Federal Government administers a number of programs that do not fall within provincial jurisdiction, such as health and welfare services for Indians and Eskimos, narcotic control, immigration health services, the sick mariner medical and hospital care program, and health and welfare programs for disabled veterans and for the Armed Forces.

**Growth in Expenditures on Public Health and Welfare since Confederation.**—During colonial days, private charity, including church aid, together with very limited public provision for institutional care of the indigent, the mentally ill and the sick, were the main social services. In 1871, four years after Confederation, Canada, with a population of approximately 3,700,000, was spending around \$1,000,000 on its public health and welfare programs. By 1950, health, welfare and income maintenance expenditures had risen to over \$1,000,000,000, while the population had increased to 13,845,000, not quite three and three-quarters times the 1871 figure.

In early times the main responsibility for poor-law provisions for the relief of the needy was left to local governments. Lack of local government organization and geographic factors in Newfoundland and Prince Edward Island made for centralized administration of relief in these two areas, while in Quebec the poor-law approach failed to gain acceptance initially because of the strength of Church charity.

The mass unemployment of the 1930's and the need for relief on a broad scale found municipalities financially unable to cope with the problem. The Federal and Provincial Governments extended financial aid in the form of grants for direct relief and for public works. At the beginning of the Second World War, the Federal Government withdrew support of unemployment relief programs and similar action was followed by most provinces, leaving the full responsibility for unemployment assistance to local governments. However, in British Columbia and Ontario substantial provincial grants are made towards local relief of 'unemployables' and their dependants, and in Saskatchewan grants are made for both employables and unemployables and their dependants. Recent legislation in Alberta and Manitoba provides for grants to aid municipalities in meeting the costs of assistance to indigent residents. In Quebec, the Public Charities Act enables the Provincial Government, the municipalities and private charity to share the costs of general assistance programs under the administration of private agencies.

Of current expenditure on health, welfare and income maintenance programs by Federal and Provincial Governments and local administrations, almost 80 p.c. is borne by the Federal Government. The bulk of the federal outlay is for cash-benefit programs, the more costly type of social security measure, as compared with health and welfare services. Provincial and municipal governments, while carrying proportionately less of the load of income maintenance programs, have an increasingly greater responsibility in the provision of services, whether impersonal environmental services such as sanitation, or personal services such as care and protection of children.

Public programs are assisted and supplemented by the work of voluntary health and welfare agencies (see pp. 252-255). The growth in professional education and number of trained health and welfare workers, and the development after the First World War of 'community chests' and welfare councils, have strengthened voluntary services both in quality and in extent of coverage.

The National Employment Service, established in 1940, has provided a useful agency for the more effective utilization of manpower resources. The high level of employment from 1940-50 minimized the amount and the duration of unemployment of able-bodied persons. Further, the operation of federal unemployment insurance since 1941, with a coverage of upwards of 3,000,000 workers, has provided a measure of protection for a large sector of the labour force.

Of fundamental importance for the future, particularly in the event of recession, is the attitude of Federal and Provincial Governments towards unemployment assistance and the Federal Government's fiscal policy and public investment program.

In addition to unemployment insurance, the Federal Government administers a number of other important income security schemes, such as the family allowances program, which provides more economic security for the family and greater stability for the economy (see p. 228). The prairie farm assistance plan (see Agriculture Chapter) offers crop insurance for prairie farmers, and support-prices for certain agricultural and fish products give a degree of income security for farmers and fishermen. War pensions and war veterans' allowances have been provided as income maintenance programs for veterans who are disabled or in need (see Veterans Affairs Chapter).

Other important public income maintenance measures in Canada include the federal-provincial old-age pension and blind pension schemes (see p. 234), and the provincial mothers' allowances (see p. 240) and workmen's compensation programs (see Labour Chapter).

**Division of Responsibility.**—In the provision of health and welfare services, the Federal Government has assisted the provincial programs through health grants and physical fitness (see p. 238) and vocational training grants (see Veterans Affairs Chapter). Federal aid has also been extended to the schools of social work to assist in the training of social workers.

Within the framework of provincial statutes, a substantial part of the responsibility for welfare is borne by municipal governments, with provincial governments taking an increasing part in co-ordination and supervision of services and in the sharing of costs. These services may include any or all of the following: family welfare; provision for the protection and support of children when normal parental care breaks down or is destroyed; protection of unmarried mothers and their children; relief in cash or kind; guidance and counselling services; institutional care, or supervision of institutional care, of aged or other needy persons; medical care to needy persons; leisure time and recreation services; special services to youth; and the maintenance of juvenile or other correctional institutions.

In most provinces, child care and protection is provided under child protection Acts which establish a central authority for stimulating and supervising child protection. Six of the ten provinces delegate the responsibility for child protection to Children's Aid Societies, a distinctively Canadian development, in areas where they are established. These voluntary Societies operate under their own citizen boards but are subject to supervision by the provincial governments and receive both provincial and municipal financial support. Provincial Child Welfare Officers are directly responsible for the protection of children who have no established residence or who reside in an area which has no Children's Aid Society.

As in the case of public welfare, responsibility for public health and medical care in Canada is divided among Federal and Provincial Governments and local administrations, with important contributions also being made by private associations and organizations. The Federal Government has certain specific health functions, centred largely in the Departments of National Health and Welfare and of Veterans Affairs (see Sect. 1, pp. 203-205) but the actual administration of public health and medical care programs, except for care provided to veterans for war-connected

disability, members of the Armed Forces, Indians and Eskimos, and other federal charges, is a provincial responsibility, carried out generally in co-operation with local governments.

No comprehensive public medical and hospital care program has yet emerged for Canada as a whole, though progress has been made in regard to health insurance during the past decade. A federal proposal to the Dominion-Provincial Conference on Reconstruction in 1945 outlined a nation-wide program of public medical care at an estimated annual cost of \$250,000,000.

The more significant advances in public health and public medical care in recent years include the introduction of the National Health Grant Program to assist provincial health services (see p. 204) and to prepare for a broad health insurance scheme; the establishment of a prepaid public medical-care scheme in Health Region No. 1 (Swift Current Area) in Saskatchewan; and the implementation of province-wide public hospital care schemes in Saskatchewan and British Columbia. With the entry of the Province of Newfoundland into Confederation a prepaid hospital-care plan was brought into the orbit of Canadian experience. In this Province, a cottage hospital scheme, which has been in operation for 15 years and which covers a considerable sector of the population, outside of St. John's, provides hospital and medical care on a prepaid basis.

## PART I.—PUBLIC HEALTH\*

The planning, supervision and financial responsibility for public health has been largely assumed by the provinces, and to a lesser extent by the Federal Government, with actual administration being carried on, principally, by municipal and other local authorities. The functions of the Federal Government are described in Section 1; the activities of the Provincial Governments are reviewed in Section 2; and institutional statistics are given in Section 3.

### Section 1.—Federal Health Activities

Federal participation in health matters is largely centred in the Department of National Health and Welfare, with certain important programs being administered by other departments such as the Department of Veterans Affairs, which provides medical and hospital care to veterans, chiefly for disability suffered as a result of war service (see Veterans Affairs Chapter); the Department of National Defence, which is responsible for the health of the Armed Forces; and the National Research Council which, through its Division of Medical Research, administers grants for, and co-ordinates, medical research. The Department of Agriculture has certain responsibilities in connection with food production.

The collection and compilation of health statistics is undertaken by the Dominion Bureau of Statistics which publishes annual, monthly and special reports on vital statistics, institutional, hospital and other health data.

Under the Department of National Health and Welfare Act of 1944 the Department is responsible for the administration of certain statutes, for research in health matters, for the enforcement of international health obligations undertaken by Canada and, in co-operation with the provinces, for the preservation and improvement of the public health.

\* Prepared by the Research Division, Department of National Health and Welfare, under the direction of G. D. W. Cameron, M.D., D.P.H., Deputy Minister of National Health.

Under the Quarantine Act the Department maintains a maritime and aerial navigation quarantine to exclude infectious diseases. It advises on the administration of sections of the Immigration Act dealing with health and conducts, in Canada and overseas, the medical examination of applicants for immigration; provides care for sick mariners as required under Part V of the Canada Shipping Act; and has certain national and international responsibilities with regard to the pollution of boundary and other waters.

Under the Food and Drugs Act, the Proprietary or Patent Medicine Act and the Opium and Narcotic Drug Act, the Department is responsible for the control of the quality of food and drugs, the registration, preparation and sale of proprietary or patent medicines, and control of the import, export and distribution of narcotic drugs.

The Department passes on the eligibility of applicants for pensions for the blind and co-operates with the provinces in the provision of remedial services for blind pensioners; it is responsible for supervision of health conditions for persons engaged on federal public works, as provided under the Public Works Health Act, and carries on a program for the conservation and promotion of the health of civil servants and other Federal Government employees. Through the Civil Aviation Medicine Division, medical advisory services are provided to the Department of Transport in all matters pertaining to the safety, health and comfort of air crew and air passengers.

**The National Health Grant Program.**—Under the National Health Grant Program, which commenced in 1948 (described in detail in the 1950 Year Book, pp. 238 to 240) annual grants, totalling over \$30,000,000 in the first fiscal year, were made available to the provinces for the extension of existing health services and facilities. The program includes grants for general public health, tuberculosis control, mental health, venereal disease control, cancer control, services for crippled children, professional training, public health research, hospital construction and for the carrying out of health surveys. For the year ending Mar. 31, 1951, the total amount made available under all grants increased to approximately \$34,500,000.

**Federal Grants to Non-Governmental Organizations.**—Grants are paid through the Department to the following non-governmental agencies engaged in health work: the Canadian Red Cross Society, the Canadian Tuberculosis Association, the Victorian Order of Nurses, the St. John Ambulance Association, the Canadian Paraplegic Association, the Canadian Mental Health Association, the Health League of Canada, the Canadian Public Health Association, the Canadian National Institute for the Blind, L'Association Canadienne Française des Aveugles, L'Institut Nazareth de Montreal and the Montreal Association for the Blind.

**Medical Care of Indians and Eskimos.**—Health services for Indians and Eskimos are administered by the Department of National Health and Welfare. In 1950, 22 hospitals and 22 nursing stations were operated by the Department which also reimburses, on a per diem or other basis, the mission and other non-federal hospitals which provide accommodation for Indians and Eskimos. Full-time departmental medical officers serve the larger Indian reserves with part-time officers serving the smaller bands. In addition, in some cases, fees are paid to local physicians for services to Indians.

**Consultative and Co-ordinating Services.**—The principal co-ordinating agency in the health field in Canada is the Dominion Council of Health, which is composed of the Deputy Minister of National Health who serves as Chairman,

the Chief Health Officer of each province and five other persons. The Council advises the Minister of National Health and Welfare on the formulation of policy. It is largely responsible for the development of an integrated and co-operative health program and for the establishment of services by the Federal Government to assist the Provincial Health Departments. Federal-provincial committees of the Council deal with specific aspects of public health.

Certain Divisions of the Department provide technical information and advice and, independently and in co-operation with other departments and agencies, conduct surveys in research and development, the evaluation of programs and procedures, and the establishment of standards. These Divisions include Venereal Disease Control, Blindness Control, Child and Maternal Health, Industrial Health, Nutrition, Mental Health, Dental Health, Epidemiology, Hospital Design, the Laboratory of Hygiene, Information Services, and Research.

## Section 2.—Health Activities of the Provincial Governments

**Newfoundland.**—Prior to Confederation with Canada, health and welfare functions in Newfoundland were administered by the Department of Public Health and Welfare. The Provincial Department of Health was established in 1949. Since there has been little development of local government, the administration of health measures throughout the Province is centralized in this Department.

Specific functions of the Department include: provision of medical and hospital care to the indigent; operation of hospitals, the cottage hospital scheme and nursing services; the carrying on of tuberculosis, communicable disease and venereal disease control programs, and inspection services. A trained nutritionist directs publicity and education programs in nutrition, and the Department takes an active part in school health programs, through educational work and by such activities as the distribution to children, through the schools, of chocolate milk-powder and cod-liver oil. A Director of Health Education has recently been added to the Department.

The Tuberculosis Dispensary at St. John's makes free diagnostic and treatment services available in the city and acts as a tuberculosis control centre for the Province. The Province subsidizes separate tuberculosis control programs conducted in the northern areas by the International Grenfell Association and the Notre Dame Bay Memorial Hospital, and assists the Newfoundland Tuberculosis Association in the conduct of surveys in other areas.

Free treatment for venereal disease is available throughout the Province and free drugs are distributed for use in all areas and doctors are reimbursed for treatment provided.

The Department operates a general hospital, a tuberculosis sanatorium and a hospital for mental and nervous diseases at St. John's. In the outports it operates 14 cottage hospitals with a total capacity of about 500 beds and equipped, with the exception of one hospital, with X-ray service, together with a number of nursing stations. At Corner Brook the Government is building a new provincial tuberculosis sanatorium and is providing financial assistance in the construction of a general hospital. Other hospitals are reimbursed for departmental cases at a daily rate. The Grace Hospital at St. John's receives an annual federal grant of about \$14,400 for maternity cases. Substantial grants are made to the Notre Dame Bay Memorial

Hospital and Clinic and to the International Grenfell Association, which serve the Notre Dame Bay area, the White Bay and St. Barbe Districts, and Labrador, respectively.

*The Cottage Hospital Scheme.*—Under the cottage hospital scheme the head of each family pays \$10 annually, and each single adult \$5 annually, for medical and hospital care. Subscribers are entitled to out-patient diagnosis and treatment, to domiciliary visits by the doctor and to hospitalization, as required, in the cottage hospitals or, when necessary, in the general hospital at St. John's or outside the Province. For maternity, hospitalization is provided only in complicated cases. In districts not served by doctors, nursing-services are provided on payment of an annual fee of \$6 for a family or \$3 for a single person.

**Prince Edward Island.**—Under the supervision of the Chief Health Officer, the Health Branch of the Department of Health and Welfare includes Divisions of Public Health Nursing, Laboratories, Tuberculosis Control, Venereal Disease Control, Cancer Control, Mental Health, Vital Statistics and Sanitary Engineering. The Director of the Mental Health Division is also the Medical Superintendent in charge of the Falconwood Hospital for mental diseases and the Provincial Infirmary. Additional facilities have been provided for the aged and infirm at Beach Grove.

The Province is divided for public health nursing purposes into six districts with a public health nurse in each district for such general health services as the inspection of school children, immunization clinics, home-visiting and home-nursing classes. One nurse, specially trained in the treatment of tuberculosis, works full time with the Division of Tuberculosis Control. The Public Health Nursing Division is also concerned with health education. Dental clinics for indigent children are operated by the Department on a part-time basis at Charlottetown and Summerside and occasionally in rural areas, with the district paying two-thirds of the cost and the Department the remainder.

The recently reorganized Division of Laboratories is establishing branch laboratories in the large hospitals to provide public health diagnostic service and clinical laboratory diagnostic service throughout the Province; four hospital branch laboratories have now been established under the supervision of the Central Laboratory at Charlottetown.

The Division of Tuberculosis Control provides diagnosis and treatment of tuberculosis by free X-ray service at tuberculosis clinics and at the 145-bed Provincial Sanatorium. Streptomycin is provided without charge where required and academic training and employment placement are made available to patients through the Rehabilitation Section of the Department. An extra-mural relief committee provides financial aid to tuberculosis patients and their families when required. The Prince Edward Island Tuberculosis League operates a mobile X-ray unit and works in close co-operation with the Department.

A 20-bed hospital for crippled children is maintained at the Provincial Sanatorium.

The Department operates two venereal disease clinics, one at Charlottetown and the other at Summerside; hospital beds are provided for selected cases and all necessary medication is supplied free of charge to persons not within reach of public health clinics.

Per diem grants are made to general hospitals for all patients and hospitals accept, without charge, all indigent persons requiring treatment. Expense of operation of the mental hospital is borne practically in full by the Province.

**Nova Scotia.**—The principal Divisions of the Department of Public Health are Laboratories, Industrial Hygiene, Neuropsychiatry, Physical Fitness, Dental Hygiene, Nutrition, the Nursing Service and Sanitary Engineering. The Deputy Minister of Health, as Deputy Registrar General, is also in charge of vital statistics.

A province-wide program of public health services is administered through seven health divisions. The city of Halifax, which operates its own Department of Health, receives financial assistance from the Province. Each Division is staffed by public health nurses and sanitary inspectors and is under the supervision of a full-time Divisional Medical Health Officer. Divisions are equipped with portable X-ray and other apparatus and provide the following services: health education, communicable disease control, environmental sanitation, public health nursing, and maternal, infant and child hygiene.

The Department has recently established well-baby clinics and has organized a hearing-test unit and a demonstration unit for home pasteurization; the Industrial Hygiene Division carries out field and laboratory investigation. Two psychiatric clinics provide field services in mental health; the Neuropsychiatric Division has conducted a survey of the inmates of county homes and hospitals. Two mobile dental clinics are operated by the Department.

Diagnostic services, including bacteriological and other examinations and milk and water analyses, are provided to physicians and health divisions by the Provincial Laboratories. Streptomycin for tuberculosis and penicillin for venereal disease cases are provided by the Province.

The five provincially owned hospitals operated under the direction of the Department are the general hospital, three tuberculosis sanatoria, and the Nova Scotia Hospital for mental cases. A cancer clinic and a Kenny treatment clinic for poliomyelitis are attached to the general hospital. Treatment for tuberculosis is free and care for mental illness is given without charge in the Nova Scotia Hospital.

A provincial per diem subsidy is given to all approved hospitals for each patient receiving treatment. An agreement between the Department of Public Welfare and the Nova Scotia Medical Society provides for medical services, including both home and office calls of a doctor, to old-age and to blind pensioners and to recipients of mothers' allowances.

**New Brunswick.**—The administration of the Health Branch of the Department of Health and Social Services is under the Chief Medical Officer, who is also Registrar-General. Divisions supervised by full-time Directors are: Hospital Services, Laboratories, Public Health Nursing, Venereal Disease Control, Tuberculosis Control, Maternal and Child Health, Mental Health, Cancer Control, Sanitary Engineering, and Dental Health. A recently established Communicable Disease Control Division is administered by the Director of Venereal Disease Control. Provincial Government hospitals consisting of two tuberculosis sanatoria and one mental hospital are operated under the supervision of medical superintendents.

Health services are administered through 16 sub-health districts; 15 of these are continuous with the counties of the Province, and the city of Fredericton forms the sixteenth. Two to four sub-districts are grouped under the supervision of one District Medical Health Officer, who is responsible for the enforcement of public health legislation within the area.

District Health Officers, assisted by public health nurses, supervise a preventive program of disease control, child and school hygiene, sanitation, immunization and health education. Municipal nurses and the Victorian Order of Nurses are subsidized by the Provincial Department of Health to aid in this work. Consultative and educational services are provided in the fields of dental hygiene, maternal and child welfare, nutrition and sanitation.

Clinics within the health districts provide X-ray and diagnostic services for tuberculosis. Cancer diagnostic clinics provide free diagnosis and free tissue examination service. Free treatment, including hospitalization when required, is provided for indigents suffering from venereal disease. Acute and immediate post-paralytic cases of poliomyelitis are hospitalized at provincial expense and hospitalization is being provided to an increasing extent for other crippling conditions in children. Pneumothorax treatment for convalescent tuberculosis patients is supplied by the Province through payment of physicians' fees. The Health Department supervises three sanatoria in addition to the two owned by the Province, and operates clinics in the larger centres.

A mental health program has been recently organized and expanded to include preventive and diagnostic clinics. The Provincial Mental Hospital provides treatment and approximately 60 p.c. of the cost is borne by the Province.

Pathological, bacteriological, serological and chemical tests are provided by the Provincial Laboratories which also supervise the distribution of vaccines, sera and bacteriologicals, including free immunizing agents, drugs for venereal diseases and insulin for indigent diabetics. The Division of Laboratories has been recently expanded to include a dental laboratory which provides specialized services.

Hospital care is subsidized by a provincial per diem grant to approved hospitals for all patients. Hospitalization in tuberculosis sanatoria is provided to all, free of charge.

**Quebec.**—The Ministry of Health, which deals with matters relating to health, preventive medicine and public charities, maintains the following Divisions: Laboratories, Sanitary Engineering, Demography, Hospitals for Mental Diseases, Public Charities, County Health Units, Epidemiology, Industrial Hygiene, Nutrition, Venereal Diseases, Tuberculosis, Health Education, and Medical Service to Settlers.

The Division of County Health Units administers 64 county health units covering 74 of the Province's 76 municipal counties. Eighteen municipalities, such as the cities of Montreal, Quebec and Sherbrooke, operate their own Health Bureaus. The Ministry of Health is responsible for the maintenance and operation of the County Health Units, with some local contributions being made to the cost. Each Unit provides full-time public health service to a county or a group of two or three adjoining counties and is administered by a full-time Medical Health Officer assisted by public health nurses and sanitary inspectors. Services provided by the Units include immunization and communicable-disease clinics, free dental, anti-tuberculosis and well-baby clinics, examination of school children, consultative services by health officers, and home visits for the follow-up of communicable disease contacts. In addition the Units have certain responsibilities in regard to sanitary measures, including approval of plans for water and sewage works and in the collection of vital statistics, health education, and the supply of biologicals.

The Medical Services to Settlers Division provides services to persons in isolated areas, through dispensaries staffed by public health nurses. These nurses, under the supervision of regional health officers, co-operate with the county health-unit staff

where possible and provide services including obstetrical care, vaccinations and immunizations, and examinations. In addition, a certain number of physicians assist the Division on a part-time fee basis.

Drugs supplied by the Provincial Department to physicians and health units include vaccines, sera, antitoxins, streptomycin for sanatoria patients and penicillin for venereal disease. Laboratory services, including bacteriological and other analyses are supplied to physicians and health units.

The Division of Public Charities is responsible, under the Quebec Public Charities Act, for the administration of hospital care for indigents. Special institutions, including hospitals for chronic and incurable cases, and institutions for mental patients and crippled children, receive grants in varying amounts; the cost of the care is apportioned on a tripartite basis to the hospital board, the municipality and the Province. Certain forms of medical aid are supplied to indigents and a number of near-indigent cases receive assistance.

The Department operates public mental institutions and supervises tuberculosis sanatoria, which are operated chiefly under private and religious auspices, with the majority of patients receiving care without charge under the Public Charities Act.

**Ontario.**—The Department of Health, which is organized under a Minister and a Deputy Minister who is also Chief Medical Officer, carries on public health services through the following Divisions: Public Health Administration, Public Health Nursing, Maternal and Child Hygiene, Dental Services, Epidemiology, Venereal Disease Control, Tuberculosis Prevention, Industrial Hygiene, Laboratories and Sanitary Engineering. The Department has also a Hospitals Division and a Director of Nurses Registration. All Divisions of the Department are served by the Departmental Solicitor and the Medical Statistician.

Public health legislation affecting water supplies, milk and food and other forms of environmental sanitation is administered by the Department. Provincial public health nurses aid local Boards of Health in the organization and promotion of public health nursing services. The Central Laboratory and 15 branch laboratories (nine regional and six subsidized) carry out bacteriological and other examinations for clinics, hospitals and private physicians.

The Division of Industrial Hygiene is responsible for the control of occupational diseases and acts as adviser to the Factory Inspection Branch of the Department of Labour, to the Workmen's Compensation Board and to industry generally.

In addition to care provided through maternal and child health clinics, any expectant mother resident in the Province may receive one free pre-natal examination; doctors are remunerated for this service by the Province. Biologicals and other materials for the prevention and control of acute communicable diseases, insulin for indigent diabetics and streptomycin for tuberculosis patients, are distributed, free of charge, by the Department.

Care is provided for the mentally ill in 15 institutions operated by the Province. Three special units are concerned with the care of epileptics, the tuberculous and the criminally insane. Travelling mental-health clinics are organized and operated with the assistance of district consultant psychiatrists. Under 1949 legislation an Alcoholism Research Foundation has been established to conduct research in alcoholism and to operate a hospital for experimentation in methods of treatment.

Public health services are administered by health units and urban health departments under the supervision of, and with financial support from, the Department. Twenty-five health units have been organized and the northern part of the Province, which is still unorganized, is provided for directly by the Department.

Clinical care in local health units is supervised by the appropriate divisions of the Department; consultative services provide diagnosis and minor treatment for venereal disease; four chest clinics are maintained for tuberculosis at various points in the Province and three travelling mass-survey units are operated; a railway dental car serves certain areas in the northern part of the Province and the Division of Dental Services is responsible for dental-health education programs and clinics in hospitals and other institutions.

Medical services are provided to old age pensioners and other recipients of social assistance under an agreement with the Ontario Medical Association. Necessary hospital care is supplied to indigents through a daily grant paid to hospital boards by provincial and municipal authorities. Hospitals are graded according to size and type and a maximum provincial and municipal per diem grant is fixed for each grade. Tuberculosis sanatoria, operated under provincial or private auspices, are subsidized by provincial grants. Provincial grants-in-aid are made to local boards of health for dental services and for venereal disease clinics. Financial assistance is offered for post-graduate study in public health nursing.

**Manitoba.**—Health activities are administered in co-ordination with welfare services by the Department of Health and Public Welfare under the direction of a Minister and a single Deputy Minister. The Department has four main Divisions: General Administration, Health Services, Psychiatric Services, and Welfare Services.

The Division of Health Services has four sections: Environmental Sanitation; Preventive Medical Services including communicable disease control, maternal and child hygiene and public health nursing; Extension Health Services, including administration of local health units, diagnostic, dental, hospital and medical care services; and Laboratory Services.

The Division of Psychiatric Services supervises the provincial mental institutions at Winnipeg, Selkirk, and Brandon and a school for the mentally defective at Portage la Prairie. It is also responsible for community mental-health services, including out-patient services, child-guidance clinics, services to courts and child-caring agencies, boarding-home care for the mentally ill, and teaching facilities.

The Province is divided into health regions composed of groups of municipalities; hospital districts, medical-care districts, medical-nursing units, and diagnostic centres are organized within these regions. The Province subsidizes the employment of doctors on a prepayment plan in medical-care districts within the health regions. Thirteen health units are in operation under full-time medical health officers, and there are 22 medical-care districts. Outside these districts, public health nurses provide emergency care, particularly to maternity patients, and operate immunization and child and maternal health clinics.

Diagnostic centres are being established throughout the Province to serve as headquarters for consultant radiologists and pathologists and to furnish laboratory diagnoses, cardiography and electroencephalography free of charge, and X-rays at a small minimum charge, to any resident within the diagnostic area who is referred to the centre by a medical practitioner. Centres at Selkirk and Dauphin are now in operation.

Clinics provide preventive and treatment services for tuberculosis, venereal disease, mental illness and cancer. Care provided for tuberculosis includes pneumothorax and other treatment in out-patient clinics of sanatoria, and X-rays and diagnoses at mobile and stationary clinics operated by the Department. A program of vocational counselling, academic and vocational training and employment placement assists in the rehabilitation of the tuberculous. Venereal disease clinics supply free diagnosis and minor treatment. The Manitoba Cancer Relief and Research Institute, which is subsidized by the Province, correlates all cancer activities. A cancer biopsy service is available without charge on a province-wide basis; X-ray and radium services for radiation therapy are available without charge in rural areas and at a charge based on ability to pay in urban areas. Out-patient services are provided at mental hospitals.

The Department distributes drugs to doctors, hospitals and government agencies throughout the health units; penicillin and drugs used in venereal disease treatment, insulin and other biologicals are included; streptomycin and other antibiotics are provided without charge to tuberculosis patients in sanatoria.

Recipients of public assistance are entitled to the services supplied within the health regions by medical care and medical nursing districts and diagnostic centres. The Province provides medical and hospital care for indigents from unorganized territory.

The Provincial Government contributes a per diem grant to hospitals and sanatoria on behalf of all public ward patients and a lump sum grant to teaching hospitals. Local health units and diagnostic units are maintained and operated by the Provincial Health Department which recovers part of the cost from municipalities served.

**Saskatchewan.**—Health activities in Saskatchewan are the responsibility of the Department of Public Health and the Health Services Planning Commission. The staffs of these agencies have recently been amalgamated and reorganized to provide for more complete integration of their functions under the unified direction of the Deputy Minister of Public Health who now serves also as Chairman of the Health Services Planning Commission. The four main branches of the Department deal with Preventive Services, Regional Health Services, Medical and Hospital Services and Psychiatric Services. In addition, an Administrative Services Branch, a Research and Statistics Branch, and a Health Education Division serve the whole Department.

The Preventive Services Branch has the following divisions: sanitation, nursing services, child health, dental health, communicable disease control, venereal disease control, nutrition, laboratories and vital statistics. The Communicable Diseases Division distributes free vaccines and sera to doctors, health departments and hospitals, and supervises immunization programs and poliomyelitis clinics at Saskatoon and Regina. The Provincial Laboratories provide clinical diagnostic service for rural physicians. Stationary and mobile tuberculosis clinics give diagnostic service and pneumothorax treatments. A Child Health Division provides services for crippled children, including mobile consultation units and a rehabilitation centre for the cerebral palsied. The Nursing Services Division provides field service for venereal disease, tuberculosis, mental health and other programs.

The Regional Health Services Branch is responsible for the organization and administration of health regions: six of fourteen potential regions are in operation. Regional Health Boards assisted by advisory committees administer general public

health services. Health Districts within the Region are represented on a District Health Council. In addition to the general public health services provided in all regions there is, in Health Region No. 1, a complete medical-care plan including general practitioner and specialist services. The plan is financed by per capita fees and a property tax, in addition to Provincial Government contributions. In many districts within the other Regions, a municipal doctor system is in operation. Medical services are provided under a contract between the municipal authority and medical practitioner.

The Medical and Hospital Services Branch is concerned with the administration of the Saskatchewan Hospital Services Plan, hospital planning and administration, medical services, municipal doctor plans and an air-ambulance service. Hospital care is available to all residents under the compulsory hospital plan, which is financed by an annual tax of \$10 for adults and \$5 for children, with a \$30 family maximum; any further funds needed are provided by the Provincial Treasury. Payment of the tax for social assistance recipients is made by the agency of government responsible for their hospital care and treatment. Separate provision is made for the free hospitalization of tuberculous and mental patients.

The Medical Services Division of the Branch supervises payment of fees to physicians, dentists, and approved hospitals for indigents outside municipal jurisdictions. In addition to hospital care, medical, dental and optical services and some drugs are provided to old-age and to blind pensioners and their dependants and to beneficiaries of mothers' allowances.

The Psychiatric Services Branch supervises psychiatric hospitals and administers community psychiatric services including clinics.

The Saskatchewan Cancer Commission, with the Deputy Minister of Public Health as Chairman, operates consultative, diagnostic and treatment clinics in Saskatoon and Regina serving all residents at public cost.

**Alberta.**—The Department of Public Health consists of the following Divisions: Communicable Diseases, Public Health Education, Hospital and Medical Services, Laboratory, Public Health Nursing, Municipal Hospitals, Social Hygiene, Sanitary Engineering and Sanitation, Cancer Services, Mental Health, Tuberculosis Control, Entomology, Vital Statistics and Nutrition Services.

Under the Public Health Act a Provincial Board of Health, consisting of the Provincial Medical Officer of Health, the Provincial Sanitary Engineer, and the Provincial Bacteriologist was established and the Province was divided into health districts. A local Board of Health was formed in each district under the supervision of the Provincial Board, which also administers health services in unorganized territories.

Eighteen Rural Health Districts, some administered by full-time medical health officers, others by public health nurses, administer a public health program which includes infant and child welfare clinics and pre- and post-natal instruction. In isolated areas public health nurses are in charge of the distribution of drugs and medical and surgical supplies and provide first-aid and obstetrical services.

Clinics operated by the Department provide the following free services to the general public: diagnosis and treatment, including drugs, for venereal disease; medical examination for cancer; mental guidance and psychiatric examinations; physical and X-ray examinations and tests for tuberculosis at stationary and travelling clinics and mobile X-ray units. The services of the Provincial Laboratory are available to all doctors, the Board of Health and approved hospitals. The Department distributes sera and biological products for preventive work.

On the recommendation of provincial cancer clinics, the Department provides surgical, X-ray and radium treatment, and hospitalization for a period up to two weeks for diagnostic purposes. Mental care in institutions is supervised by the Department of Public Health and patients unable to pay are treated at public expense. Hospitalization in provincial tuberculosis sanatoria is provided without charge for all resident tuberculosis patients. Out-patient pneumothorax services are available.

The Province provides full medical (including specialist) services, optical and extensive dental services to old-age and to blind pensioners, recipients of mothers' allowances, and their dependants. The Department also provides all residents suffering from the after-effects of poliomyelitis with free medical, surgical and hospital care and rehabilitation services. Hospital and medical care are provided for children suffering from rheumatoid arthritis. Maternity patients may be hospitalized at provincial expense for a twelve-day period. In addition a small money grant may be given to any needy expectant mother.

More than one-third of the population of the Province is provided with hospitalization at a minimum charge through the Municipal Hospitals Act. Provincial financial contributions include grants towards the operation of health units, per diem grants to approved hospitals, special per diem orthopædic grants as well as contributions to the Edmonton Rural Health Unit and the Edmonton Health Department for specific services.

**British Columbia.**—The Department of Health and Welfare is divided into two branches, under the supervision of the Deputy Minister of Health and the Deputy Minister of Welfare.

The Health Branch is divided into three bureaus, two of which are located at Victoria, one at Vancouver. The Bureau of Local Health Services, at Victoria, consists of the Nutrition Service and the Division of Health Units, Public Health Nursing, Environmental Sanitation, and Preventive Dentistry. Also at Victoria are headquarters of the Divisions of Vital Statistics and Public Health Education which are grouped in the Bureau of Central Administration. The Divisions of Tuberculosis Control, Venereal Disease Control and Laboratories have their headquarters at Vancouver, and are grouped in the Bureau of Special Preventive and Treatment Service. An Assistant Provincial Health Officer, in charge of the Vancouver District Office of the Health Department, represents the Deputy Minister of Health in the Vancouver area.

In addition to certain province-wide activities, the Health Branch through its Bureau of Local Health Services supervises local public health activities. The Province is divided into Health Units and Public Health Nursing Districts each consisting of several school districts. Ten of the 18 Health Units planned are in operation and provide a generalized health program. In more isolated areas, the Public Health Nursing Districts, staffed by public health nurses and sanitary inspectors, operate as forerunners to Health Units. Vancouver and Victoria have their own Health Departments; other centres have part-time medical officers. With these exceptions all field public health personnel are employed by the Provincial Department. Approximately 94 p.c. of the population of the Province is served by full-time trained public health personnel.

General public health services are operative throughout the Health Units and unorganized territory. Stationary and mobile tuberculosis clinics provide free diagnostic and consultative service to all residents; venereal disease clinics, operating in Vancouver and on a part-time basis throughout the Health Units, provide free diagnosis and treatment—where there is no clinic, the Health Department pays private physicians for treatment of indigent patients; maternal and child-health clinics, providing immunization and pre- and post-natal advice, are operated by public health nurses. Several specialized divisions of the Health Branch provide consultative service and guidance to the field staff, other departments, and official and voluntary agencies. There are branch laboratories in various parts of the Province and the Division of Laboratories distributes immunizing agents free of charge to doctors, health officers and public health nurses. There has been a recent expansion of the mental hygiene program. The Crease Clinic of Psychological Medicine was opened at Essondale in 1949 to function as an investigatory and active treatment centre.

Except in the two metropolitan areas where special federal grants are made under previous arrangements, approximately one-third of the cost of health services is borne by the local districts and the remainder by the Provincial Government.

Institutions for the hospital care of tubercular and of mental patients and Provincial Infirmaries for persons with incapacitating disabilities are operated by the Provincial Government; indigents are hospitalized in these institutions at public expense.

Hospital care is available to all residents through the compulsory prepayment plan administered by the Hospital Insurance Commission. The plan is financed by annual premiums, amounting in 1950 to \$21 for a person without dependants and \$33 for a person with one or more dependants, supplemented by provincial and municipal contributions.

Full medical, surgical and obstetrical care are provided to recipients of social assistance and to their dependants who are also covered under the terms of the Hospital Insurance Act, their premiums being paid by the Province.

### Section 3.—Institutional Statistics\*

Since 1930, the Dominion Bureau of Statistics has co-operated with the Provincial authorities through the Census of Institutions in the collection of nationwide statistics for hospitals, sanatoria and mental institutions. In order to provide a brief outline of hospital conditions in Canada, the tables in this Section were prepared with data selected from the Dominion Bureau of Statistics yearly publications on Institutional Statistics. Information is also collected, quinquennially, for charitable and benevolent institutions. The latest statistics for these two groups are for 1946; they appear, respectively, at p. 288 of the 1950 edition, and at p. 308 of the 1948-49 edition of the Year Book.

For statistical purposes, hospitals are divided into three main groups on the basis of their range of admissions: public hospitals that accept all patients regardless of ability to pay; federal hospitals, operated by three Federal Government Departments, that render service to specific groups of citizens; and private hospitals that are ordinarily restricted to paying patients.

Public hospitals may be subdivided into two groups, according to the rate of turnover of patients. Hospitals for acute diseases form the first group and chronic diseases hospitals, mental institutions, and tuberculosis sanatoria, together form the second. Hospitals with relatively rapid turnover, i.e., hospitals for acute diseases, are further grouped into general or special according to the type of medical care provided. Special hospitals include contagious diseases, womens, childrens, convalescent, Red Cross and unclassified hospitals.

The number of hospitals operating in Canada in 1948 is shown in Table 1, according to type and province. A more significant picture of the relative importance of facilities in Canadian hospitals is provided by Table 2, which shows the distribution of bed capacity in 1948, by provinces, according to type of hospital. A comparison of data in both tables will reveal the relative size of hospitals of various types.

Two important factors must be taken into account for an effective interpretation of the information in these tables. First it must be noted that bed capacity expresses the number of beds for which a hospital was designed. It is calculated on the basis of a standard floor area per bed which varies throughout the country. It is not necessarily, nor usually, identical with the number of beds actually set up. By its use, overcrowding is eliminated as a disturbing factor in certain kinds of statistical studies. The actual bed complement, though not provided in this Section, is available in specialized publications and may be compared with bed-capacity figures to obtain a measure of overcrowding in hospitals.

The fact that many institutions also provide care of a kind different from the classification in which they have been placed should also be taken into account. A major distortion which may occur in the interpretation of these tables is provided for in Table 1 and in Table 10. Table 1 indicates the number of units of public hospitals which are reserved for tuberculosis patients. Table 10 includes the bed capacity of these units in a detailed analysis of bed capacity in tuberculosis institutions.

\* Except where otherwise indicated this Section has been revised in the Institutions Section of the Health and Welfare Division, Dominion Bureau of Statistics.

### Subsection 1.—Statistics of Public Hospitals for Acute Diseases

Movement of patients, personnel and hospital facilities for in-patients in both general and special public hospitals during 1948 are summarized in Tables 4 and 6. Comparative workload, staff per patient, etc., may be obtained from these data. The last item, in Table 5, cost per patient day, where revenues and expenditures are divided into main sources and objects respectively, provides a significant connection between patient and financial statistics.

**Organized Services.**—Organized services analysed in Table 6, are specialized hospital departments or services in charge of qualified specialists. Many of the smaller public general hospitals have available certain facilities for specialized services but, since these are not organized they are not included in the figures in Table 6.

**Organized Out-Patient Departments.**—Out-patient departments are operated by hospitals for the treatment of patients who do not usually occupy in-patient beds. The extension of out-patient services to patients of modest means has far-reaching and beneficial effects. It may eliminate unnecessary admissions to in-patient wards of hospitals or may serve to secure necessary hospitalization.

## Subsection 2.—Statistics of Mental Institutions

The 57 mental institutions operating in Canada during 1948 include two Federal Government and two private institutions. The three public institutions in British Columbia are reported as one hospital. Data in Table 8 provide information from all these institutions. Total patients shown in the table include 4,808 non-residents, either on parole or boarding out, distributed by province as follows: Nova Scotia, 126; New Brunswick, 455; Quebec, 1,486; Ontario, 1,964; Manitoba, 174; Saskatchewan, 301; Alberta, 83; and British Columbia, 219.

Some indication of the overcrowded conditions in mental hospitals may be gathered from a comparative study of relevant information in Tables 2 and 8. Only Prince Edward Island and Nova Scotia reported resident populations below rated bed capacity.

Financial data for 1948 shown in Table 9 cover only public mental institutions, and include neither private institutions (one in Ontario and one in British Columbia) nor Federal Government institutions (one in Quebec and one in Ontario).

## Subsection 3.—Statistics of Tuberculosis Institutions

Table 10 shows that 25 p.c. of total bed capacity provided for tuberculosis patients in 1948, i.e., 3,572 out of 14,512 beds, were not located in public sanatoria. The importance of Federal Government and public general hospital units is such that movement-of-patient statistics in Table 11 include data from these units. As a result, comparison of patient and personnel statistics would be misleading, since the latter involve only personnel of public sanatoria.

Deaths from tuberculosis in these institutions during 1948 were 47 p.c. of the total deaths from the disease in Canada, as shown in the Chapter on Vital Statistics at p. ... of this Volume. However, the death rate from this disease has shown an encouraging decline since 1926.

cover contracts for care of patients in units of other hospitals.

## Subsection 4.—Statistics of Federal Government Hospitals

Hospitals operated by the Federal Government are conducted for special purposes connected with departmental administration such as: care of war veterans and members of the Armed Forces, quarantine and care of immigrants and lepers, care of Indians, etc. Table 1 shows the number of such hospitals and Table 2 gives the bed capacities of these hospitals compared with those in other categories for 1948.

**Veterans Affairs Hospitals.\***—To replace outmoded buildings with modern fire-proof construction, the Department of Veterans Affairs opened a new mental infirmary of 260 beds at London, Ont., during 1950.

Progress was made on major construction projects at the Lancaster Hospital, Saint John, N.B., where new facilities are being provided and at Quebec city where a complete new hospital is under construction. Architectural plans were well advanced for the extension to Queen Mary Veterans' Hospital, Montreal, Que., and the Veterans' Home at Victoria, B.C. The latter is a 60-bed extension to the present hospital. Preliminary planning was proceeded with in respect to the 300-bed replacement at Winnipeg, Man., the 200-bed extension and replacement at Calgary, Alta., the 300-bed replacement at London, Ont., and the 250-bed replacement at Vancouver, B.C. Some preliminary studies were also carried out on replacement of the old St. Anne's Hospital, Ste. Anne de Bellevue, Que., and of Government House, the present Veterans' Home at Edmonton, Alta. The following institutions were closed during the year: Christie Street Hospital, Toronto, Ont.; Veterans' Home, Halifax, N.S.; and the Veterans' Home, Saint John, N.B.

Accommodation and movement of patients is shown by type of hospital for 1949 in the following table.

\*Revised by the Department of Veterans Affairs.

### 1.—Accommodation and Movement of Patients in Veterans Affairs Hospitals, 1949

<sup>1</sup> Closed.

*Veteran Patients Classified by Status.*—As at Dec. 31, 1948 and 1949, the numbers of patients in Veterans Affairs hospitals were 7,291 and 7,806, respectively, classified according to status and treatment groups as follows:—

Patient Strength	1948	1949	Treatment Groups	1948	1949
First World War	3,952	4,640	General	5,353	5,982
Second World War	2,925	2,735	Tuberculosis	805	648
Other	414	431	Mental	1,133	1,176

Clinical treatments in 1949 numbered 689,827 and in 1948, 506,249.

**Department of National Defence Hospitals.\***—Table 14 shows accommodation and movement of patients in National Defence hospitals for the year 1949. Twenty-two of these hospitals were equipped with laboratory facilities and nine with physiotherapy services. All were equipped with X-ray and out-patient facilities.

\* Revised in the Department of National Defence.

In addition, there were 10-bed completely equipped sick quarters (Royal Canadian Air Force) available for emergency cases at St. Hubert in Quebec, Toronto, Camp Borden and Clinton in Ontario, Chatham in New Brunswick and Sea Island in British Columbia. Hospitalization in these areas is carried out in existing Veterans Affairs hospitals or civilian hospitals. Approximately 54,000 out-patient treatments were given to Navy, Army and Air Force personnel, civilians, Eskimos and Indians in the Royal Canadian Air Force hospitals, emergency sick quarters and medical inspection rooms.

There are sick bays with 2 to 12 beds in each ship of the Royal Canadian Navy in commission. Suitable sick quarters are likewise provided in all Navy and Army establishments where hospitals do not exist.

<sup>1</sup> Opened April, 1949.

<sup>2</sup> Integrated with Department of Veterans Affairs hospital at same location.

<sup>3</sup> Figures for "Movement of Patients" are for November and December, 1949, only.

**National Health and Welfare Hospitals.**—Table 15 gives statistics of the hospitals administered by the Department of National Health and Welfare. The immigration detention hospital at Quebec, the largest of such institutions, has X-ray, laboratory and physio-therapy facilities as well as a social service and an out-patient department. The other hospitals are small and, with the exception of a clinical laboratory at Lunenburg and an out-patient department at Sydney, have no special services.

The low number of patient days at immigration hospitals, in contrast with the number of beds, is explained by the fact that these hospitals must maintain a sufficient number of beds to accommodate any sudden influx of patients whose treatment demands immediate quarantine.

## PART II.—PUBLIC WELFARE AND INCOME SECURITY\*

Public welfare, traditionally and constitutionally a Provincial Government responsibility, has in recent years, as a result of the new concept of social security, been shared by the Federal Government, e.g., Unemployment Insurance following amendment of the British North America Act, and Family Allowances. In 1944, the Department of National Health and Welfare was established to promote social welfare in matters over which the Federal Parliament has jurisdiction, except for services administered by other Federal Departments, such as the welfare of Indians and Eskimos and welfare services to veterans. The duties of the Department

\* Except as otherwise indicated, this Part has been revised by the Research Division, Department of National Health and Welfare, under the direction of G. F. Davidson, Ph.D., Deputy Minister of National Welfare.

include the administration of the Family Allowances Act, the federal aspects of the Old Age Pensions Act, and of the National Physical Fitness Act. Federal grants to the schools of social work and to the Canadian Welfare Council are also made through the Department of National Health and Welfare.

## **Section 1.—Federal Government Programs**

### **Subsection 1.—Family Allowances**

The Family Allowances Act, 1944, was introduced as a basic social security measure designed to assist in providing equal opportunity for all Canadian children. The allowances, which involve no means test, are paid entirely out of the Federal Consolidated Revenue Fund and are not part of taxable income under income tax.

Under the Act and amendments, allowances are payable in respect of every child below the age of 16 years who was born in Canada or has been a resident of the country for one year, or whose father or mother was domiciled in Canada for three years immediately prior to the birth of the child. Payment is made monthly, and normally to the mother although any person who substantially maintains the child may be paid the allowance on its behalf. The allowances are paid at the monthly rate of \$5 for each child under 6 years; \$6 for each child from 6 to 9 years; \$7 for each child from 10 to 12 years; and \$8 for each child from 13 to 15 years. The amendment of April, 1949, reduced the residence requirement from three years to one and removed the provision whereby allowances for the fifth and each subsequent child were reduced.

The allowances are paid by cheque, except for Eskimo children and a group of Indian children for whom payment is made largely in kind because of lack of exchange facilities in remote areas and the need for education in the use of nutritive foods.

If it is satisfactorily shown to the authorities that the allowances are not being spent for the purpose outlined in the Act, payment may be discontinued or made to some other person or agency on behalf of the child. Allowances are not payable for any child who fails to comply with provincial school regulations or on behalf of a girl who, although she is under 16 years of age, is married. The Act provides that if any person is dissatisfied with a decision as to his right to be paid the allowance, or as to the amount of allowance paid, he may appeal the decision to a specially constituted tribunal.

Family Allowances are administered by the National Director of Family Allowances of the Department of National Health and Welfare through Regional Directors in offices located in each provincial capital. A welfare section in each Regional Office deals with welfare questions arising out of the administration of allowances. A Supervisor of Welfare Services advises each Regional Director and reports through him to the Chief Supervisor of Welfare Services, who acts in a similar advisory capacity to the National Director. The actual preparing and issuing of the cheques is the responsibility of the treasury division of each Regional Office which reports to the Chief Treasury Officer of the Department of National Health and Welfare.

The Regional Director for Yukon and the Northwest Territories, located at Ottawa, is responsible for payments to families in those areas. Close co-operation is maintained with the Departments of Citizenship and Immigration and of Resources and Development which are responsible for the welfare of Indians and Eskimos, respectively (see Subsection 7, p. 232-234).

<sup>1</sup> Based on gross payments for March.<sup>2</sup> Totals shown for the years 1947 and 1948 are adjusted to account for overpayments and other corrections and, therefore, differ slightly from those in previous editions of the Year Book.<sup>3</sup> Payment of Family Allowances began Apr. 1, 1949.

## Subsection 2.—Unemployment Insurance

In 1940, by an amendment to the British North America Act, the Federal Government was given jurisdiction in the field of unemployment insurance and the Unemployment Insurance Act was passed, establishing a national system of unemployment insurance which is outlined in the Labour Chapter.

### Subsection 3.—National Employment Service

The National Employment Service is operated in conjunction with the Unemployment Insurance scheme. It is administered by the Commission through the employment and claims offices and supervised by the Federal Department of Labour. A description of the program is given in the Labour Chapter.

### Subsection 4.—Veterans' Programs

*Veterans' Unemployment Assistance.*—The Department of Veterans Affairs does not place veterans in employment, but works closely with the Department of Labour in connection with veterans' problems. Out-of-work benefits are authorized in certain cases as outlined in the Veterans Affairs Chapter.

*Veterans' Pensions.*—Canadian pension legislation arising out of the First and Second World Wars has been discussed in previous issues of the Year Book (see pp. 759-760 of the 1943-44 Year Book; pp. 1139-1143 of the 1947 Year Book and pp. 1146-1148 of the 1948-49 Year Book). In this edition the account is outlined in the Veterans Affairs Chapter.

*Veterans' Allowances.*—In addition to war pensions, allowances are paid to certain non-pensionable veterans at 60 years of age, or earlier if the veteran is permanently unemployable, or to eligible veterans who, having served in a theatre of actual war, are incapable and unlikely to become capable of maintaining themselves because of economic handicaps combined with disabilities. These allowances are outlined in the Veterans Affairs Chapter.

*Veterans' Welfare Services.*—Welfare and rehabilitation services for veterans, as administered by the Department of Veterans Affairs, are outlined in the Veterans Affairs Chapter.

### Subsection 5.—Prairie Farm Assistance

The Prairie Farm Assistance Act is administered by the Department of Agriculture and a description of the program is given in the Agriculture Chapter.

### Subsection 6.—Government Annuities\*

Under the Government Annuities Act (c. 7, R.S.C., 1927, amended by c. 33, 1931) passed in 1908, the Federal Government carries on a service to assist Canadians to make provision for old age. The Act is administered by the Minister of Labour.

A Canadian Government annuity is a fixed yearly income purchased from and paid by the Government of Canada. The annuity is payable in monthly instalments for life, or for life and guaranteed for a period of years. The minimum annuity is \$10 and the maximum \$1,200 a year. Annuity contracts may be deferred or immediate. Under deferred annuity contracts purchase is by periodic or single premiums. Immediate annuity contracts provide immediate income.

---

\* Revised by the Government Annuities Branch, Department of Labour.

The property and interest of the annuitant is neither transferable nor attachable. In the event of the death of the annuitant before a deferred annuity vests, all money paid is refunded to the purchaser or his legal representative with interest. Provision is made in the Act for group annuity contracts, whereby employers may contract for the purchase of annuities on behalf of their employees, or associations on behalf of their members, the purchase money being derived partly from wages and partly from employer contributions. Group annuity plans now in effect cover a variety of industries and many municipal corporations throughout Canada.

From Sept. 1, 1908, the date of the inception of the system, up to Mar. 31, 1950, the total number of annuity contracts and certificates issued was 292,978. Of these, 34,299 have been cancelled (including 4,691 cancelled in 1949-50) leaving in effect on Mar. 31, 1950, 258,679 contracts and certificates. The total amount of purchase money received up to Mar. 31, 1950, was \$593,302,705.

Up to Mar. 31, 1950, 846 corporations, institutions and associations, as compared with 809 up to Mar. 31, 1949, had entered into agreements with the Government to purchase annuities. Under these agreements, 121,986 employees or members were holding certificates for purchase of deferred annuities as compared with 113,645 one year earlier. The number of certificates issued under groups in the year 1949-50 was 15,689 as compared with 29,869 in the previous year.

Up to June, 1940, annuity payments were, with certain exceptions, exempt from taxation under the Income War Tax Act. Under contracts issued after that date, income was fully taxable until the Act was amended in 1945. Under the amendment, the capital element in contractual annuities issued since June, 1940, was declared exempt from taxation, the portion representing interest being subject to tax as income. The change applied to income of 1945 and subsequent years.

## 2.—Government Annuities Contracted and Purchase Money Received, Years Ended Mar. 31, 1927-50

NOTE.—Figures for the years 1909 to 1926 will be found at p. 873 of the 1942 Year Book.

## Subsection 7.—Welfare Services for the Indian and Eskimo

**Indian Welfare.\***—In the interests of national economy as well as for humanitarian reasons the Federal Government, through the Department of Citizenship and Immigration, promotes at public expense a number of activities designed to advance the well-being of the Indian population on Indian Reserves and throughout northern Canada. Those that might be termed welfare projects include, besides general welfare, the payment of family allowances, the administration of the

\* Prepared by T. R. L. MacInnes, Secretary, Indian Affairs Branch, Department of Citizenship and Immigration.

Veterans' Land Act and the promotion of handicrafts. A detailed account of the welfare work done among Indians is given at pp. 1170-1177 of the 1948-49 edition of the Year Book.

During the year ended Mar. 31, 1950, in pursuance of the policy of improving housing on many reserves, 1,197 new houses were built and 2,271 were repaired. Provision was made for the construction of an additional 922 houses in 1950-51, most of the labour to be supplied by the owners. A total of \$1,325,342, in the form of a basic ration of groceries rather than money, was supplied to indigent Indians. Sick and aged indigent Indians, on the recommendation of medical officers, received special rations including milk, fresh vegetables, fruit and eggs, particularly during convalescence. In addition, 4,100 indigent aged Indians received cash allowances amounting to \$386,744 and provision was made for the expenditure of \$1,063,500 for that purpose in 1950-51. Progress was made in the co-ordination and promotion of adult and physical education, particularly in Alberta and British Columbia where courses in these fields were initiated in co-operation with provincial universities.

Family allowances are paid to Indian women as they are to the other women of Canada. Experience has proved that, with few exceptions, the Indian mother uses the allowances for the purposes for which they are intended. Improved clothing and more adequate school lunches are a direct result. Up to Mar. 31, 1950, family allowances to Indians amounted to \$3,500,000.

More than 1,000 Indian veterans have taken advantage of rehabilitation grants provided under the Veterans' Land Act and have invested them in houses, farms, trap-lines and commercial fishing projects.

**Eskimo Welfare.\***—One of Canada's most challenging welfare-administrative problems is the task of assisting the Eskimos to adjust themselves to changing conditions, while at the same time attempting to preserve their racial characteristics and personality traits. This problem calls for the continued co-operation of the Royal Canadian Mounted Police, missionaries, traders, medical personnel and others who have contact with these interesting and wholesome people. The Department of Resources and Development is responsible for general welfare and educational services.

Administrative supervision of Eskimo affairs has long been conducted through the annual Eastern Arctic Patrol. Recently, however, more frequent inspection trips by boat and air have afforded a closer liaison between the Departments concerned and their local representatives, and a correspondingly more efficient administration of Eskimo affairs.

The Royal Canadian Mounted Police act as local representatives of the Government in all matters affecting Eskimo welfare and economy. They also supervise the issuance of relief to widows and the helpless and arrange for the evacuation of the seriously ill to hospital.

Medical and health services are provided by Indian Health Services of the Department of National Health and Welfare, assisted by residing missionaries, traders and the R.C.M.P. A number of nursing stations have been set up and mission hospitals with resident Government doctors are maintained, with the assistance of Government grants, at Aklavik, Chesterfield Inlet and Pangnirtung.

\* Prepared under the direction of Roy A. Gibson, Director, Administrative Officer, Department of Resources and Development.

Government doctors and dentists usually accompany the Eastern Arctic Patrol to treat the natives at each point of call. Tuberculosis surveys have been made and many victims of this disease have been brought out to sanatoria for treatment.

The assistance rendered through the payment of family allowances has proved of great benefit to the native people. Eskimos do not receive family allowances by cheque, but are paid in kind according to an authorized list of goods restricted to items of benefit to growing children. Large quantities of powdered milk and other prepared foods are among the commodities supplied.

An allowance of \$8 per month in goods to Eskimos over 70 years of age was authorized during 1948 and is being wisely used.

Attention is being given to the provision of a suitable educational program for the Eskimos and a number of schools, staffed by welfare teachers, have been established, sometimes in conjunction with the nursing stations.

Game preserves have been established where only natives may hunt and the game laws are designed to conserve caribou and other wildlife for the benefit of the native population. The inadequacy of these resources to support the native population under present conditions is becoming an acute problem and arrangements have been made to rehabilitate certain groups of Eskimos from areas where game is scarce to areas where the wildlife resources are more plentiful.

The Canadian Government has for a number of years operated a reindeer project near Aklavik as a possible means of improving the economic condition of the Eskimos. Research is going on to determine the possibility of developing other resources such as fisheries, thus broadening the native economy. In conjunction with the Canadian Handicrafts Guild, steps are being taken to encourage and organize a handicraft industry. To a limited extent, employment other than hunting and trapping is gradually becoming available to the Eskimos who have excellent potentialities.

## **Section 2.—Federal-Provincial Programs**

### **Subsection 1.—Old Age Pensions and Pensions for the Blind**

Old Age Pensions and Pensions for the Blind, which are paid jointly by the Federal and Provincial Governments, are authorized by the Old Age Pensions Act, 1927, and amendments. The amendment of 1937 authorized pensions for the blind. The original Act and amendments up to 1947 are outlined at pp. 258-260 of the 1948-49 Year Book. The amendment of Apr. 30, 1949, effective May 1, 1949, raised the maximum monthly pension to which the Federal Government may contribute. Old Age Pensions became effective in the different provinces and territories on various dates between 1927 and 1949 (see Table 5, p. 235.).

Old Age Pensions up to a maximum of \$40 per month may be paid to persons aged 70 years and over whose annual income, including pension, is not more than \$600 for a single person, \$1,080 for a married person, or \$1,200 if married to a blind person. Pensions are paid to blind persons 21 years of age or over, whose maximum annual income, including pension, is not more than \$720 for a single person, \$920 if there is a dependent child or, in the case of married persons if the total income of the couple, including pension, is not more than \$1,200 or \$1,320 if both are blind. The exact pension payable in each case depends on the amount of outside income and resources of the pensioner. To be eligible for the Old Age Pension or a Pension

for the Blind, the applicant must have resided in Canada for 20 years immediately preceding the proposed commencement of pension, or, if absent from Canada during that time, must have had a previous residence equal to twice the length of the period of absence.

Old Age Pensions and Pensions for the Blind are not paid concurrently, or together with an allowance under the War Veterans' Allowance Act, 1946, or to an Indian as defined by the Indian Act, and Pensions for the Blind are not paid together with a pension for blindness under the Pension Act. As of Mar. 31, 1950, 282,584 persons, representing approximately 45 p.c. of the total population aged 70 years or over were in receipt of Old Age Pensions, and Pensions for the Blind were paid to 10,517 persons.

The Federal Government contributes, in respect of each person in receipt of pension, a sum not exceeding 75 p.c. of \$40 monthly or of the monthly amount paid by the province, whichever is less, so that while the province may pay a higher maximum pension within the income limits fixed by the Act, the Federal contribution is payable only in respect of \$480 annually. Pensions are paid by the provinces, with Federal Government reimbursement being made through the Department of National Health and Welfare. The provinces are responsible for payment of their administrative costs.

Since 1942, certain provinces have paid supplementary allowances in addition to pensions. Some of these were discontinued as the maximum pension available under the federal legislation was increased. As of March, 1950, the following provinces were paying supplements: British Columbia, \$10; Alberta, \$10; Saskatchewan, up to \$2.50. Yukon also pays a monthly supplement of \$10.

Implementation of the Old Age Pensions Act in any given province is contingent upon the province passing enabling legislation and signing an agreement with the Federal Government. Each provincial plan must be submitted to the Governor in Council for approval and may not be changed without consent. Administrative responsibility for the program is vested in the individual province where a Board or Commission acts as the pension authority. The federal aspects are administered by the Old Age Pensions Division of the Department of National Health and Welfare.

<sup>2</sup> Based on population estimate for preceding June.

<sup>3</sup> In March, 1950, a monthly pension of \$40 was paid to the one blind pensioner in Northwest Territories.

**Joint Committee of the Senate and the House of Commons on Old-Age Security.**—From April to June, 1950, the Joint Committee on Old Age Security gave careful study to the operation and effects of the existing old age pension program in Canada and reviewed the present provisions for old-age income security in Australia, New Zealand, Denmark, Sweden, the United States, Great Britain, France and Switzerland.

In considering possible alternative measures for old-age security in Canada, the Committee gave special attention to representations received from Provincial Governments, from representatives of agricultural, labour, business and welfare organizations and from a number of well-known authorities in various aspects of

social security. The Committee reviewed the financial and constitutional aspects of old-age security and studied the relationship of old-age security to other Federal programs, such as war veterans' allowances, unemployment insurance, government annuities, and the housing program under the National Housing Act.

*Findings of the Committee.*—In its Report, which was tabled on June 27, 1950, the Committee recommended a universal flat-rate pension of \$40 a month payable to everyone 70 years of age or over, subject to a residence requirement and administered by the Federal Government. As a complementary measure, the Committee recommended a pension of \$40 a month, payable to persons in need between the ages of 65 and 69 inclusive, with a test of eligibility somewhat similar to the one under the present old-age assistance program. This assistance program, in the opinion of the Committee, should be financed jointly by the Federal and Provincial Governments on a 50-50 basis, with the Provincial Governments administering the eligibility test.

An estimated \$388,000,000 for the year 1950-51 would be required to implement this program; the estimated Federal Government cost would be \$356,000,000 and the balance would be paid by the Provincial Governments.

With respect to the methods of financing the federal share of the costs, the Committee favoured the contributory principle, in particular, a tripartite arrangement involving contributions from individuals, employers and the general revenues of the country. If any constitutional change were necessary to introduce an earmarked social-security tax, it was suggested that Federal and Provincial Governments might consider an amendment that would give concurrent jurisdiction to Parliament and the Provincial Legislatures in the field of old-age security, since the participation of both federal and provincial legislation is, obviously, necessary to a satisfactory old-age security program.

The Committee drew attention to the need for adequate provision to meet other needs of the aged, such as medical and hospital care, housing and welfare services and employment. It also pointed out the value of employee pension plans and private savings as a means of supplementing the recommended pension.

### Subsection 2.—National Physical Fitness Program

Under the National Physical Fitness Act of 1943, a joint federal-provincial program of physical, cultural and recreational activities is conducted to improve the total fitness of the people of Canada. The program is designed primarily to assist and stimulate local community activity, with the Federal and Provincial Governments having as their main concern the initiation and provision of services requested by the community.

Through the Act, federal grants totalling \$225,000 annually, paid on a matching per capita basis, are made available each year to those provinces that undertake to promote a fitness and recreational program as provided in the Act. By the end of 1950, eight provinces were participating in the program. When Newfoundland entered Confederation in 1949, special provision was made for an additional \$7,000 to be made available for that Province should it choose to participate.

The National Council on Physical Fitness, composed of not fewer than three nor more than ten members appointed by the Governor in Council, was established under the Act. The Council, which meets at least semi-annually, serves in an advisory capacity to the Minister of National Health and Welfare and provides liaison between the different levels of government and with national voluntary

organizations actively engaged in the fitness and recreation field. Some participating provinces have established similar advisory bodies; others utilize interdepartmental committees.

The Physical Fitness Division of the Department of National Health and Welfare administers the grants to the provinces, performs the administrative work of the National Council on Physical Fitness, co-operates with other Federal Departments and with national agencies and organizations, collects and distributes information originating in this and other countries, interprets the national program of fitness through publications and reports, and is concerned with the conducting of research, experiments and demonstrations.

Provincial programs are administered by the Departments of Education in all provinces except Nova Scotia and Manitoba where they are the responsibility of the Department of Public Health and the Department of Health and Public Welfare, respectively. Saskatchewan and Manitoba have passed provincial physical fitness legislation; programs in other provinces are operated under departmental regulation. The actual carrying out of fitness and recreation projects is, principally, a local responsibility and the provincial program is therefore organized with a view to strengthening and aiding the community and agencies active in the field. The underlying policies are: the development of a program of fitness in relation to the needs and determined priorities of the local community; the courses and, in some instances, the payment of salaries; co-ordination and extension of existing agencies, with programs being initiated only where agencies are not available to undertake them; and, in certain provinces, the provisions of financial aid to local programs approved by the province.

Liaison with other countries was strengthened by the visit of the Assistant Director of the Division to the Lingiad in Stockholm, Sweden, and the International Congress for Physical Education for Girls and Women in Copenhagen, Denmark. In Canada increasing co-operation between national organizations interested in fitness and recreation programs was achieved through the joint meetings held in April, 1949, by the National Council on Physical Fitness and the Canadian Drama Festival and by convening a second National Conference of Sports Governing Bodies.

The development of the program in all provinces has been characterized by emphasis on community recreational planning which is particularly Canadian in character. An important trend has been the great increase in co-operative effort through the donation of labour by members of the community for construction projects and the sharing among small centres of facilities and equipment. Shortage of trained personnel remained the most serious obstacle to the expansion of programs. To assist in overcoming this shortage the Federal Government again provided a number of scholarships, to be awarded on the recommendation of the National Council, for the post-graduate training of fitness and recreational personnel.

The Division has prepared and published many booklets and pamphlets on community recreation, facilities and equipment and has been especially productive in the field of theatre arts. In co-operation with the National Film Board, a film strip on *Simplified Staging* was completed. Films used for instructional purposes to further the fitness movement include *Fit for Tomorrow*, *Fitness is a Family Affair*, and *When all the People Play*. In addition, films from other sources, approved by national appraisal committees, are made available through the preview film library service maintained by the Physical Fitness Division.

### 7.—Federal Grants, Available, and Amounts Paid Under the National Physical Fitness Act, 1944-50

### Subsection 3.—Training Programs

Under the Vocational Training Co-ordination Act of 1942 and amendments, the Federal Department of Labour, in co-operation with the Provincial Governments, carries on various training projects. Details of these schemes will be found in the Labour Chapter.

## Section 3.—Provincial Programs

### Subsection 1.—Mothers' Allowances

All provinces have statutory provision for allowances to enable certain needy mothers to remain at home to care for their dependent children. The first Act was passed by Manitoba in 1916, and four other provinces enacted similar legislation between 1917 and 1920. The Nova Scotia and Quebec Acts came into effect in 1930 and 1938, respectively; the New Brunswick Statute of 1938 became effective in 1943; and the Prince Edward Island and Newfoundland Acts of 1949 became effective July 1, 1949, and June, 1950, respectively.

The total cost of Mothers' Allowances is paid from provincial treasury funds except in Alberta, where 20 p.c. of the cost of the allowance is charged to the municipality of residence. In Quebec, the provision permitting a levy of not more than 5 p.c. of an allowance on a municipality has not been implemented.

Two conditions of eligibility are required by all provinces: means test and residence. The amount of outside income and resources allowed varies from province to province. Residence in the province at the time of application is required by each province, but the necessary period of previous residence varies from one year in Saskatchewan and Newfoundland, to two years in Ontario and Manitoba, three years in British Columbia, New Brunswick, Nova Scotia and Prince Edward Island, and five years in Quebec. The Alberta Act requires the husband to have had his home in the province at the time of his death, his committal to an institution, or his desertion. In all provinces the child or children must live with the recipient of the allowance and, in most, in the province by which the allowance is being paid.

Nationality is an important condition of eligibility in all provinces except Alberta, Saskatchewan, Ontario and Newfoundland. In Quebec the mother either must possess Canadian citizenship by birth or must have been a Canadian citizen for 15 years or must be the wife or widow of a Canadian citizen. The other provinces either require that the applicant be a British subject or the wife or widow of a British subject, or that her child be a British subject. In Nova Scotia the applicant herself must be a British subject and in Prince Edward Island, New Brunswick and

Manitoba the child is eligible if he is a British subject even if the mother is not. In British Columbia a mother may be eligible if she is or was a British subject by birth or naturalization. In New Brunswick, Nova Scotia, and Prince Edward Island an allowance may not be paid to an Indian as defined by the Indian Act of Canada.

Since the introduction of the legislation there has been a general extension of coverage. As of June, 1950, an applicant must be a widow or her husband must be mentally incapacitated or, except in Alberta, he must be totally and permanently disabled. Total and permanent physical disability is defined in various ways: for example, in British Columbia and Quebec the physical disability must be such that it may reasonably be expected to last at least one year, and in Saskatchewan and Newfoundland the specified period is nine months or more. All provinces except Alberta consider a mother eligible for an allowance if her husband is receiving treatment for tuberculosis.

Deserted wives who meet specified conditions are eligible in all provinces except Nova Scotia, but the period that must elapse after desertion varies from one to seven years. In certain circumstances, mothers who have been divorced or legally separated from their husbands are eligible in British Columbia, Manitoba, Ontario and Newfoundland and in Saskatchewan a divorced mother may be paid an allowance. Subject to certain conditions, foster mothers caring for children whose parents are dead or disabled are eligible for allowances. In Saskatchewan and Newfoundland, when the mother is deceased or in a mental institution or sanatorium, the allowance may be paid to the father if he is incapacitated and living at home with the children. All provinces grant allowances in respect of legally adopted children but in some cases the child must have been adopted by the husband and wife jointly. In Manitoba, Saskatchewan, Alberta and British Columbia allowances are paid for children born out of wedlock if certain conditions are fulfilled.

Since the 1949 amendment to the Nova Scotia Act, mothers of one or more children have been eligible in all provinces. Allowances may be paid in respect of children under the age of 16, except in Manitoba where the age limit is 15 years. In special circumstances the age limit is extended: Saskatchewan, Ontario, Quebec, New Brunswick and Newfoundland continue, until the end of the academic year, the allowance paid in respect of a child who has reached 16 years of age if he is attending school; British Columbia and Alberta pay an allowance in respect of a child attending school until he has reached 18 years; British Columbia and Manitoba pay allowances in respect of children under 18 who are mentally and physically handicapped; and Quebec and Saskatchewan continue the allowance until a child is 19 to 21 years of age, respectively, if he is physically or mentally unable to work. Six provinces also make provision for payment of allowances to needy mothers not strictly eligible under the terms of the Act. In other provinces cases of this kind are generally cared for under social assistance or relief.

In each province the Act is administered by public welfare authorities and most provinces have a Board or Commission to make decisions regarding eligibility and amounts of allowance to be paid. Advisory Boards or local advisory committees are appointed to make recommendations regarding the operation of the Acts. The legislation in British Columbia and Alberta provides for reciprocal agreements with other provinces for the payment of allowances, but no such agreements are in effect.

In all provinces the amount of allowance granted is fixed by the administrative authority on a means-test basis. Table 8 shows the maximum monthly rates of allowance in each province. Table 9 gives statistics for the individual provinces providing mothers' allowances.

## 8.—Maximum Monthly Rates of Mothers' Allowances as of May, 1950

NOTE.—Actual amounts are set after consideration of circumstances of each applicant.

Province	Mother and One Child	Each Additional Child	Disabled Father at Home	Family	Supplementary
Newfoundland	\$25.00	\$5.00	\$5.00	\$50.00	Up to \$20.00 if necessary for proper care and maintenance.
P. E. Island	\$25.00	\$5.00	No additional allowance granted.	\$50.00	None granted.
Nova Scotia	No set maximum: rates based on average family income for community in which family lives.		No special provision: included in budget on which allowance is based.	\$80.00 (Minimum \$15.00)	None: fuel and winter clothing included in budget.
New Brunswick	\$27.50	\$ 7.50	No additional allowance.	\$60.00	Director may grant an additional \$7.50 for rent if circumstances require it but only if allowance paid is below maximum: fuel and winter clothing included in allowance.
Quebec	\$30.00 (population under 5,000) \$35.00 (population 5,000 or over)	\$1.00 for 2nd, 3rd, 4th, 5th. \$2.00 for 6th, 7th. \$3.00 for each subsequent child.	\$ 5.00	No amount set. (Minimum \$5.00)	\$5.00 if recipient physically or mentally unable to work: fuel and winter clothing included in allowance. Allowance may be continued for short periods when father on leave of absence from a mental hospital or recovered from tuberculosis but still unable to work full-time.
Ontario	\$50.00 for mother and 1 child. \$24.00 for foster mother and 1 child.	\$10.00 \$48.00 foster mother and 2 children with \$10.00 for each additional orphan child.	\$10.00	No amount set.	\$10.00 where need is apparent to the Commission. Allowance for fuel based on size of home and cost of coke from Oct. 1 to May 31 of previous year. Winter clothing included in allowance and/or supplementary allowance.

8.—Maximum Monthly Rates of Mothers' Allowances as of May, 1950—concluded

Province	Mother and One Child	Each Additional Child	Disabled Father at Home	Family	Supplementary
Manitoba	\$48.00—includes food, clothing and operating expenses.	\$ 9.00 for child aged 1-6 years. \$11.75 for child aged 7-11 years. \$14.00 for child aged 12-14 years.	\$15.75	\$137.00	Up to \$25.00 if necessary: fuel allowance granted; winter clothing included in budget.
Saskatchewan	\$25 for mother and 1 child. \$15 for guardian and 1 child.	\$10.00 for 2nd. \$ 5.00 for each subsequent child. \$75.00 for 8 mother and ten or more children.	\$10.00	\$85.00	Local municipality may grant supplementary aid under Social Assistance program. Costs shared equally by the Province and municipality.
Alberta	\$45.00	\$15.00 for 2nd. \$10.00 for 3rd, 4th. \$ 8.00 for 5th. \$ 7.00 for 6th. \$ 5.00 for 7th, 8th, 9th or more.	No additional allowance.	\$110.00	Supplementary assistance may be provided by municipality of residence, with Province reimbursing 80 p.c. of amount paid. Fuel and winter clothing included in allowance.
British Columbia	\$42.50 plus \$7.50 from Social Allowance funds, less \$5.00 if family owns home.	\$7.50 plus \$1.00 from social allowance funds.	\$7.50 plus \$1.00 from social allowance funds	Maximum set but no limit to number who may benefit.	Extra expenditures, such as needed repairs to the home and loss of possessions through fire, can be met through social allowance funds. No special fuel allowance. Nutrition allowance available for tuberculosis patients and families.

## Subsection 2.—Welfare Services

Provincial welfare services generally are administered by Provincial Welfare Departments which also have supervisory authority over municipal welfare programs. Local voluntary agencies are incorporated, in most cases, under provincial law. The following outline covers provincial public welfare services, that is, measures of child care and protection, care of the aged, social assistance or relief and special services. Old age pensions and pensions for the blind are dealt with separately at pp. 234-237 and mothers' allowances at pp. 240-243. The medical services available to recipients of social assistance and aged persons are described at pp. 205-214.

**Newfoundland.**—Public welfare services are administered by the Department of Public Welfare.

**Child Care and Protection.**—With the exception of orphanages, child welfare has developed as a public service. Regional officers, acting under the Director of Child Welfare, administer the Welfare of Children Act which includes legislation dealing with neglected children, children of unmarried parents, adoptions, mentally defective children, juvenile delinquents and training schools. The Child Welfare Division pays for the maintenance of neglected children who, by court order, are made wards of the Director and are placed in foster homes. The Division also operates an Infants Home providing short-term care for children up to two years

of age. Orphanages are specifically outside the jurisdiction of the Welfare of Children Act and are administered by religious organizations, with government subsidies at the rate of \$100 per annum for each child admitted.

By statute, the Director of Child Welfare is judge of the Juvenile Court, which is located at St. John's. The Division maintains a Boys Home and Training School and a Girls Home and Training School with accommodation for 164 and 17, respectively.

The Province contributes towards the cost of educating blind and deaf-mute children in institutions at Halifax, N.S., and Montreal, Que.

*Care of the Aged.*—The Province maintains a Home for the Aged and Infirm at St. John's and also pays a per diem rate for needy old people in the Salvation Army Home and in approved boarding homes.

*Social Assistance.*—Under the Dependents' Allowances Act, which came into effect in 1950, the Province may grant assistance to needy unemployables. Allowances vary from \$300 a year for one adult to \$780 a year for a family of five incapacitated adults, and may not be paid to people already receiving mothers' allowances, old age pensions, or pensions for the blind.

**Prince Edward Island.**—The Province constitutes a single welfare unit, and public welfare services are administered by the Department of Health and Welfare. The city of Charlottetown and the seven incorporated towns are, however, charged with the care and maintenance of their own needy residents.

*Child Care and Protection.*—Under the Children's Protection Act, which became effective in March, 1950, the custody and control of children found by the Juvenile Court to be neglected or delinquent is given to the Director of Child Welfare or to an approved Child Welfare Agency. The children are placed in foster homes, boarding homes and children's institutions which are inspected by the Director. Provincial grants are made to child welfare agencies and to the two private orphanages, one Protestant and one Roman Catholic.

*Care of the Aged.*—The aged and infirm are cared for in the Falconwood Mental Hospital and Provincial Infirmary. The Beach Grove Infirmary, when completed, will provide accommodation for an additional 250 people.

*Social Assistance.*—The Department provides relief in rural areas, and assists Charlottetown and the seven incorporated towns by a grant of 50 p.c. of accepted social assistance payments.

**Nova Scotia.**—Public welfare services are administered by the Department of Public Welfare.

*Child Care and Protection.*—The Child and Family Welfare Branch administers the Child Welfare Act and the Adoption Act, inspects all children's institutions, and licenses foster homes and maternity homes. It also operates the Nova Scotia Training School for mentally defective children and the Nova Scotia School for Boys for juvenile delinquents, and is responsible for the operation of six Juvenile Courts and the supervision of their probation staff.

Under the Child Welfare Act of May, 1950, neglected children are made wards of the Director of Child Welfare or of approved children's aid societies and are placed either in foster homes or child-caring institutions. Each of the 12 children's

aid societies receives annually from the Province a grant of up to \$2,000; a sum equal to 25 p.c. of any money raised through private campaigns or received from municipalities for general operating expenses; and an additional grant of not less than \$1,000, with the maximum determined on a per capita basis. The Province also pays \$156 annually towards the maintenance of each child and, unless a court order is made against the parents, the municipality of settlement is required to contribute an amount up to \$260.

Under the Act, mentally defective children may be made wards of the Director and committed to an approved institution; the municipality of settlement is then required to pay \$350 annually for their maintenance. Financial provision for children in reformatories is made at the rate of \$350 from the municipality of settlement, with an additional \$350 from the Province if the reformatory complies with specified standards.

*Care of the Aged.*—Aged persons are cared for in homes maintained by municipalities and by religious or private organizations, as well as in private boarding homes where the municipality of settlement may contribute to the costs of maintenance. All homes are subject to provincial inspection, but there is no provincial aid other than old age pensions.

*Social Assistance.*—Relief to unemployables is a local responsibility.

**New Brunswick.**—Public welfare services are administered by the Department of Health and Social Services.

*Child Care and Protection.*—Responsibility for protection and placement services is largely delegated to the 17 children's aid societies, one in each county and one in each of the cities of Fredericton and Moncton. Orphanages are operated by religious, private or, in certain cases, municipal organizations. With few exceptions, boarding homes for children must be licensed and are subject to provincial inspection, as are all child-caring institutions. The Province and the municipality of residence each pay \$225 annually towards the maintenance of every child committed to any institution or home. The Department may place blind or deaf-mute children in the School for the Blind and School of Deaf Mutes at Halifax, N.S.

*Care of the Aged.*—Homes for the aged are operated under municipal, religious, fraternal, or private auspices. They are subject to provincial inspection but receive no financial support from the Province other than old age pensions.

*Social Assistance.*—Relief to unemployables is a local responsibility.

**Quebec.**—Major responsibility for the administration of public welfare services is shared by the Department of Health and the Department of Social Welfare and Youth. The latter is responsible for preventive and rehabilitative work among juvenile delinquents; it grants subsidies to recreation groups, camps, sports, parks and playgrounds; and administers old age pensions and needy mothers' assistance.

The Department of Health administers the Public Charities Act which embodies the Provincial Government policy of granting subsidies to religious and private institutions wherever they exist rather than creating public services. Under the Act, provision is made for subsidies to institutions on a per diem basis, with the Province paying one-third of the cost of maintenance of indigent persons admitted, the municipality of residence paying one-third and the institution the remainder.

*Child Care and Protection.*—Needy or abandoned children are cared for, largely, in institutions such as orphanages, industrial schools, nurseries, and other homes assisted under the Public Charities Act. There is a trend towards foster-home care

and increasing use of social-work methods in institutions. Training and rehabilitation programs are carried on in the six industrial schools and four reform institutions to which children are committed. A Child Guidance Clinic in the Montreal Juvenile Court operates directly under the jurisdiction of the Minister of Social Welfare and Youth as part of the provincial program for the prevention of juvenile delinquency.

Children who have been exposed to tuberculosis, but who have not been infected, are placed with rural families under the supervision of the Department of Health in co-operation with local doctors and clergy.

*Special Services.*—Aid to Youth, a program under the Department of Social Welfare and Youth, provides vocational guidance and scholarship grants to young people. The Department also sponsors some 50 specialized training schools and correspondence courses.

*Care of the Aged.*—Institutional care for indigent old people is provided under the Public Charities Act.

*Social Assistance.*—Relief to families is not provided in Quebec but institutional care for indigents is available under the Public Charities Act. The Department of Colonization operates a program whereby needy families are settled on the land in newly opened districts, and are supervised and granted financial aid until they become self-supporting.

**Ontario.**—Public welfare services are administered by the Department of Public Welfare. The Welfare Units Act, 1948, authorizes single municipalities, districts, or groups of municipalities or districts, to establish welfare units to improve and co-ordinate the administration of services, and provides for provincial payment of 50 p.c. of administrative costs.

*Child Care and Protection.*—The Children's Aid Branch of the Child Welfare Division is responsible for the administration of the Children's Protection Act, the Children of Unmarried Parents Act and the Adoption Act, and for supervision of the 53 children's aid societies and all institutions for children in the Province. Under the Children's Protection Act, the Province is enabled to reimburse municipalities against which an order has been made for the maintenance of wards of a children's aid society to the extent of 25 p.c. of the net municipal expenditure, and to make grants to children's aid societies equal to 25 p.c. of the amount they raise through private campaigns for funds. These grants are in addition to the appropriate token grants based on the grading status of each society.

The Day Nurseries Branch of the Division administers the Day Nurseries Act, 1946, which regulates the establishment, operation and supervision of day nurseries in Ontario. A municipality establishing a day nursery may receive a provincial contribution equal to one-half its expenditures on operation and maintenance.

*Care of the Aged.*—Institutions for the aged are operated under provincial supervision by municipalities, districts, and religious and benevolent societies.

Under the Homes for the Aged Act, 1949, municipalities, including counties, cities and separated towns, are required to establish homes for the aged or to provide institutional care for their aged through agreement with other municipalities. Homes for the aged are also to be established in districts when authorized by a majority of municipalities. The Province contributes 50 p.c. of the net cost of maintaining such homes as well as 50 p.c. of the cost of constructing new homes

or enlarging existing homes, provided the plans are approved by the Minister of Public Welfare. In districts, the Province may also pay that portion of construction costs allocated to the unorganized territory.

Under the Charitable Institutions Act, all private institutions for the aged must be approved by the Province; they are entitled to a small per diem grant for each needy person maintained, including old age pensioners.

*Social Assistance.*—Regulations under the Unemployment Relief Act authorize the Department of Public Welfare to reimburse municipalities 50 p.c. of the amount expended on assistance to unemployables, up to a specified maximum. In unorganized areas this program is administered and financed by the Department.

*Assistance to Veterans.*—The Soldiers' Aid Commission extends advice and emergency assistance to ex-service men of the First and Second World Wars and to their families.

**Manitoba.**—Public welfare services are administered by the Public Welfare Division of the Department of Health and Public Welfare.

*Child Care and Protection.*—In unorganized territory, basic child care and protection services are provided by the Division of Public Welfare. In most of the municipally organized areas, these services are maintained by four children's aid societies which receive substantial provincial support under a system of matching grants. Payments are based on a formula of the number and cost of social workers per 100,000 population in a representative area where the Province provides child-welfare services. Under agreement between the societies and the Government, payment is made conditional on the provision of a basic level of service and the collection of equivalent voluntary contributions.

The cost of maintenance of wards is paid by the municipality of residence, but the Province refunds a portion of these costs from a \$300,000 annual fund to be shared by municipalities in proportion to their relief and child-welfare expenditures.

The Child Welfare Division provides foster-home care and supervision for mental defectives placed under the custodianship of the Director. The Broadway Home at Winnipeg, an advanced training school for mentally defective girls, comes under the joint direction of the Divisions of Public Welfare and Psychiatry.

*Care of the Aged.*—All institutions and nursing homes caring for the aged and infirm are supervised and licensed by the Provincial Department of Health and Welfare under Public Health Regulations. The largest of these institutions, with 420 beds, accepts only applications made through public authorities where a definite guarantee of maintenance is provided by either the Province or the municipality. Other than this, no financial assistance is given by the Province.

*Social Assistance.*—The Province provides aid to transient indigents and to persons in unorganized territory. The municipalities are responsible for the provision of assistance to their residents but these expenses, as well as ward maintenance costs, are partly reimbursed by the Province from the \$300,000 annual fund allotted on a pro rata basis.

**Saskatchewan.**—Public welfare services are administered by the Department of Social Welfare and Rehabilitation.

The Department is divided into four main branches: Child Welfare, Old Age Pensions, Social Aid and Corrections. The Social Welfare Board, consisting of the Deputy Minister as Chairman and the Directors of the four major branches, supervises the granting of all forms of assistance provided by the Department and acts in an advisory capacity to the Minister of Social Welfare.

*Child Care and Protection.*—The Child Welfare Act and the Education of Blind and Deaf Children Act are administered by the Child Welfare Branch, and involve supervision of child-welfare services in the Province. Children's aid societies in Moose Jaw and Saskatoon provide these services. When possible, children are placed in foster homes, and in some cases older children are placed on farms under wage agreements. The Child Welfare Branch operates five child-caring institutions where Government wards are sheltered until they can be returned to their parents or placed in foster or adoption homes. A portion of the maintenance costs of wards is paid by the municipality of residence, except for children born out of wedlock where an attempt is made to recover from the father. Financial responsibility, however, is limited so that it will not exceed one mill of the municipality's tax rate, and ceases when the child reaches 16 years of age.

*Correctional Services.*—Responsibility for administration of the provincial gaols rests with the Corrections Branch of the Department. The Branch is also responsible for the Industrial School for Boys, the four provincial penal institutions, and for probation services. Provincial correctional services are being revised to provide for better segregation and for adequate vocational training and social case work.

*Care of the Aged.*—The Department operates two homes for the aged and infirm, providing accommodation for 183 persons. Where necessary, assistance is granted by the municipality of residence and, under the social-aid program, is shared on a 50-50 basis by the Province. The Social Welfare Act provides for the licensing and supervising of all privately operated homes.

*Social Assistance.*—The needs of indigent persons are met jointly by the Social Aid Branch and the various municipal units. The Province contributes 50 p.c. of the cost of food, clothing and shelter furnished by municipalities to needy residents, employable and unemployable, and bears the entire cost of assistance to transients. Through the Department of Public Health needy mothers may receive grants not exceeding \$25 prior to or immediately following the birth of a child.

*Métis Rehabilitation.*—The Branch operates a farm where the Métis—persons of mixed Indian and White blood who do not qualify under the Indian Act—are instructed in modern methods of farming while being paid for their work; two schools are conducted for Métis children.

*Special Services.*—A Division of the Social Aid Branch provides training and placement services for the handicapped and crippled; one-half the cost of this training is borne by the Province and one-half by the municipality of residence.

**Alberta.**—Public Welfare measures are administered by the Department of Public Welfare which is divided into seven main branches: Public Assistance, Child Welfare, Mothers' Allowances, Old Age Pensions, Rehabilitation, the Single Men's Division and the Veterans Welfare Commission.

*Child Care and Protection.*—The care of children who are made wards of the Government following neglect or delinquency, or indenture and agreement, is under the exclusive control of the Child Welfare Commission. Such children may be

placed in foster homes, paid boarding homes or institutions. Financial responsibility for wards of the Government, for whom a maintenance order has been issued by the Court, rests with the municipality of residence. However, under the Public Welfare Assistance Act, 1949, the Province may provide grants of up to 60 p.c. of the maintenance costs. Reform schools for incorrigible delinquent children are maintained, and other delinquent children are placed in private homes under the supervision and inspection of the Home Investigating Committee of the Department.

*Care of the Aged.*—Under the Home for Aged or Infirm Act, 1945, the Province reimburses municipalities 50 p.c. of the costs of maintaining aged or infirm persons resident in municipally licensed homes. The grants may not exceed a prescribed maximum and are contingent upon maintenance of certain standards.

*Social Assistance.*—The Province pays the total cost of assistance to indigent families who have no municipal residence and to indigent families in unorganized districts. Municipalities are responsible for assistance to their needy residents but the Public Welfare Assistance Act, 1949, authorizes provincial grants to the municipalities of up to 60 p.c. of these assistance costs. The Maternal Welfare Act provides for a grant of up to \$15 to needy mothers prior to or immediately following the birth of a child.

The Bureau of Public Welfare operates a rehabilitation service to families by settling them on suitable farm lands. The Single Men's Division maintains four hostels, one each at Edmonton and Calgary and two in rural areas, to care for unemployable, single, homeless men without permanent municipal domicile. Single ex-service men are cared for at Calgary and Edmonton without being institutionalized. The Province assumes the cost of these projects.

*Métis Rehabilitation.*—The rehabilitation of the Métis is the responsibility of the Métis Rehabilitation Branch and has been carried out by the setting aside of tracts of land as Métis Settlement Areas, where settlers have exclusive fishing, hunting and trapping rights and where they are encouraged to engage in lumbering, agriculture and stock-raising. Educational and social services are provided, and government-operated stores sell goods at cost price.

**British Columbia.**—Public welfare services are administered by the Social Welfare Branch of the Department of Health and Welfare.

*Organization and Field Service.*—For administrative purposes, the Province is divided into five Regions with 27 District Offices. This decentralized administration allows for regional payment of social allowances and professional supervision of staff. Generalized field service to all persons receiving assistance is given by provincial social workers in the territory to which each is assigned.

Under the Social Assistance Act, cities and municipalities of over 10,000 population must have their own social welfare departments to administer the Social Assistance Act and to give case-work services to old age pensioners and mothers' allowance recipients. The Province pays 50 p.c. of the salaries of municipal social workers or, where more than one is needed, matches the municipal appointees worker for worker. Smaller municipalities may either have their own social welfare departments or pay the Province 15 cents per capita each year for the services of the Social Welfare Branch. Five municipalities have only one social worker each and eight have an amalgamated staff. The remainder pay the 15 cents per capita alternative.

*Child Care and Protection.*—The administration of the Protection of Children Act, the Adoption Act, the Children of Unmarried Parents Act, and the placement of children in foster homes is carried on by the Child Welfare Division, except at Vancouver and Victoria where children's aid societies are located. Administration of the boys and girls industrial schools, family case work and rehabilitative supervision of boys and girls released from the schools are carried on in co-operation with the Juvenile Courts.

*Care of the Aged.*—The Provincial Home is operated for the care of aged men. Several cities and municipalities also operate homes for the aged; grants of 33 p.c. of the capital cost of construction are made by the Province. Municipal homes, private institutions and boarding homes are licensed and supervised. The costs of maintaining indigent residents, as well as any maintenance costs over and above the old age pension, are shared on an 80-20 provincial-municipal basis.

*Social Assistance.*—The Family Division administers the Social Assistance Act which provides for the granting of social allowances to needy individuals or families, counselling services to families even if financial aid is not required, health services, occupational training or retraining, as well as boarding and foster-home care.

The Province reimburses the municipalities 80 p.c. of the cost of social assistance, with the exception of old age pensions, pensions for the blind and mothers' allowances to which the municipalities do not contribute.

*Special Services.*—Certain divisions of the Health Branch of the Department of Health and Welfare include social services as part of their treatment. Medical social workers, appointed by the Social Welfare Branch, serve patients of the Tuberculosis Sanatoria and Venereal Diseases Clinics and their families. Provincial institutions and hospitals also have social-service programs, and case-work services are provided in the Provincial Mental Hospital and child guidance clinics. Social workers report on the social history of all infirmary applicants and work in collaboration with doctors in a hospital-clearance program carried on under the direction of the Inspector of Hospitals.

Federal Departments use the services of the Social Welfare Branch co-operatively in connection with social investigations required in any part of the Province.

### Subsection 3.—Workmen's Compensation

In all ten provinces, legislation is in force providing for compensation for injury to a workman by accident arising out of and in the course of employment, or by a specified industrial disease. A summary of provincial legislation is given in the Labour Chapter.

### Subsection 4.—Care of the Dependent and the Handicapped

Detailed statistics of charitable and benevolent institutions in Canada are made available quinquennially and, as reported for the 1946 Census, appear at p. 288 of the 1950 edition of the Year Book.

### PART III.—NATIONAL VOLUNTARY HEALTH AND WELFARE ACTIVITIES\*

**Canadian Welfare Council.**—The Council, established in 1920, is a national association of over 1,200 organizations and individual citizens in partnership to secure comprehensive, well-administered social services of high quality for the Canadian people. It furnishes authoritative information, technical advice and field service in the main areas of social welfare and provides a means of co-operative planning and action by serving as a link between the public and private agencies.

Membership is open to individuals and to associations. Among the member organizations of the Council are community chests and councils, a wide variety of private social agencies, various federal, provincial and municipal departments and other groups active in the fields of health, welfare and education.

The policies and program of the Council are determined by its members with the help of a nationally representative elected board of governors. Aided by a professional staff who provide both central office and field services, the members work together in these divisions: Child Welfare, Family Welfare, Recreation and Youth Services, Public Welfare, Delinquency and Crime, Community Chests and Councils. In addition to the divisions, there are standing committees on research, volunteer social work, field services and personnel in social welfare. A department of French-speaking services and a department of public relations maintain liaison between the Council staff, Council members and the public.

Some subjects to which the Council has given study are the regulation of child labour, controls for juvenile immigration, Canadian adoption laws as a step towards improved adoption procedure in all provinces, needs of the aged, public assistance, residence and settlement legislation, rehabilitation of the disabled and a large number of surveys on a variety of subjects, requested by agencies, communities and provinces.

In addition to its magazines, *Canadian Welfare* published eight times a year and *Bien-être social canadien* published five times a year, the Council issues reports, pamphlets, briefs and division bulletins and an annual directory of Canadian welfare services. It organizes conferences, institutes and lectures and holds a two- to three-day annual meeting.

The Council has a broad basis of support. Its annual budget is financed by grants and assessments from community chests, Federal and Provincial Government grants, donations, memberships and payments for special services.

**Canadian Conference of National Voluntary Health and Welfare Organizations.**—This organization was set up in April, 1949, following a two-year series of informal meetings of executives of national voluntary agencies who met to explore the need and possibility of co-operation in matters of common concern. The Conference provides national health and welfare agencies with a clearing-house and a medium for exchange of experience and for joint study and action.

**Canadian Committee of Youth Services.**—This Committee was established in June, 1949, for the purpose of providing a medium for joint planning and action on the part of Canadian organizations concerned with youth welfare.

\* Prepared by the Research Division, Department of National Health and Welfare, under the direction of G. D. W. Cameron, M.D., D.P.H., Deputy Minister of National Health, and G. F. Davidson, Ph.D., Deputy Minister of National Health.

**The Canadian Red Cross Society.**—The peacetime program of the Society consists of eight major services. The operation of outpost hospitals and of a blood transfusion service are important projects receiving attention within nearly all provincial divisions. Nutrition and visiting homemaker's services, and the teaching of swimming and water safety are carried on in most branch areas. In addition, relief is supplied in times of national and international disaster; craft training and recreational centres are operated for hospitalized war veterans and a national inquiry bureau traces persons for the purpose of reuniting families and friends.

The Canadian Junior Red Cross promotes health and good citizenship in schoolroom branches across Canada. As part of its program, the Junior Red Cross Crippled Children's Fund is maintained to assist in providing treatment for handicapped children.

**The Victorian Order of Nurses for Canada.**—The Victorian Order of Nurses is a voluntary public health agency, national in scope and having as its primary object the care of the sick in their own homes by visiting nurses. The Order provides a community service available to everyone in the area served. Care is given under medical direction by visiting nurses to medical, surgical and maternity patients, a large percentage of whom would otherwise be without skilled nursing services. Patients are expected to pay the cost of the home visits, but fees are scaled according to family income and service is never refused because of inability to pay.

Part-time nursing service is given in industrial plants where the number of employees does not warrant full-time employment of a nurse. In smaller centres where the Order provides the only public health nurse, the program is usually enlarged to include school nursing, assistance at immunization clinics and child health centres and other public health services.

**The Health League of Canada.**—The Health League of Canada is a voluntary association devoted to a program of health education. Through the media of press, radio, posters, pamphlets, motion pictures and the public platform, the League keeps the public informed concerning the health value of milk pasteurization, immunization procedures for preventable diseases, proper nutritional habits, sanitary work practices by public food-handlers and organized health programs for industrial workers. Particular divisions deal with these specific health problems; a social hygiene division conducts a program against the spread of venereal disease. The League supplements its year-round program with the annual sponsoring of National Health and National Immunization Weeks.

**The Order of St. John.**—The Order of St. John in Canada has its headquarters and national offices at Ottawa, branches in every province and local centres in hundreds of cities, towns and villages throughout Canada. The Order has two subsidiary branches, the St. John Ambulance Association and the St. John Ambulance Brigade, the first devoted to teaching, the second to rendering voluntary public assistance as required. The primary purpose of the Order is to teach first-aid, home nursing, child welfare, sanitation, hygiene and kindred subjects to citizens of Canada irrespective of age, race and creed, and to provide trained and organized personnel to help in time of disaster or national emergency. The Canadian branch was organized in 1895 and, since that time, more than 1,250,000 persons have

been trained and have passed examinations in the various subjects. A blood-grouping program was started early in 1943 so that compatible donors might be obtained with the least possible delay in emergencies.

**The Canadian Arthritis and Rheumatism Society.**—The Canadian Arthritis and Rheumatism Society was incorporated in 1948 for the purpose of reducing morbidity and mortality from arthritic and rheumatic diseases. Its objectives include the raising of funds to support research, for the education of professional personnel and of the general public, and for the promotion and organization of treatment facilities. The Society's plans to organize divisions in all provinces had been implemented by the end of 1949 in British Columbia, Saskatchewan, Manitoba, Ontario and Quebec. In that year also the pilot scheme of the Society, covering out-patient diagnostic service, in-patient care and mobile unit, was set up in British Columbia. The diagnostic service is supplied through arthritis clinics and a mobile unit which brings treatment facilities to those unable to leave home. A Medical Advisory Board composed of leading physicians, surgeons and scientists advises on the research program, professional education and public relations.

**The National Cancer Institute of Canada.**—The National Cancer Institute was incorporated in 1947 for the purpose of correlating cancer control activity in Canada and of establishing and maintaining cancer research. Its program includes the sponsorship of research projects through grants-in-aid and fellowships, professional education, the co-ordination of provincial cancer control programs and the operation of the Canadian Tumour Registry at Ottawa. The Canadian Tumour Registry utilizes the technical facilities of the Laboratory of Hygiene of the Department of National Health and Welfare to diagnose unusual tumours and to act as a central tumour library. The Institute has advisory committees on radiation therapy and on records and statistics.

**The Canadian Cancer Society.**—This Society, incorporated in 1938, works under a joint director with, and acts as a fund-raising body for, the National Cancer Institute. The Society has branch divisions in nine provinces and these provide services particularly in the fields of lay education and welfare. The services vary from province to province but include assistance from social-service workers, provision of free cancer dressings and medicines, of nursing care, of transportation and living accommodation.

**The Canadian Tuberculosis Association.**—The Association, which was founded in 1900, is active in fund-raising for the purpose of educating the general public in tuberculosis prevention and of sponsoring services for the tuberculous. Services are provided through provincial branches; the Saskatchewan branch operates the provincial tuberculosis control program in that province. In several provinces services include assistance in the diagnosis, treatment and rehabilitation of the tuberculous through the employment of teachers of vocational and academic subjects, the operation of mobile X-ray units and generally through co-operation in tuberculosis control programs of provincial health departments.

**The Canadian Mental Health Association.**—The Canadian Mental Health Association operated between the years 1918 and 1950 as the National Committee for Mental Hygiene. The Committee worked for the conservation of mental health and the prevention of mental disorders; it has studied mental health conditions in Canada and has sponsored mental health projects such as a teacher-training course designed to provide liaison officers between the school and the mental health clinics, and a psychiatric centre for work with social agencies in the community. The Association is continuing and expanding the interests of the Committee, through the formation of provincial branches to make consultative and educational services more immediately available to the whole population.

**Other National Health Organizations.**—Additional voluntary agencies are engaged in a variety of health activities including financial support and operation of educational programs, research and training, and the provision of treatment. These activities may be directed towards the general public or towards specific categories of ill or disabled persons, such as the paraplegics. Some organizations, such as those dealing with the blind and the deaf, are interested in the welfare as well as the health problems of the groups served. Organizations of professional medical and related personnel, in particular of public health personnel, assist in the development of agencies and in guiding their activities.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

**Canadian Criminal Law and Procedure†.**—The system under which justice is administered in a State is never rigid. This is neither expedient nor indeed possible. The judicial system must grow and adapt itself to the requirements of the people, and the exact limits of the powers of the federal and provincial legislative bodies have required and will still require added definition by the courts.

The exclusive legislative authority of the Parliament of Canada extends to criminal law throughout Canada. This law is based on the common law of England built up through the ages and consisting first of customs and usages and later of principles enunciated by generations of judges and introduced into Canada as regards criminal law, by Royal Proclamation, 1763.

The judicial systems of the provinces as they exist to-day are based upon the British North America Act of 1867. Section 91 provides that "the exclusive legislative authority of the Parliament of Canada extends to . . . the criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters". In each province (Sect. 92, ss. 14), the legislature may, exclusively, make laws in relation to "the administration of justice in the province, including the constitution, maintenance and organization of provincial courts both of civil and of criminal jurisdiction and including procedure in civil matters in those courts". The Parliament of Canada may, however (Sect. 101), establish any additional courts for the better administration of the laws of Canada.

It is frequently difficult to distinguish between "law" and "procedure". Procedure may be interpreted to relate simply to the organic working of the courts, but in a wider sense it may also affect the rights or alter the legal relations arising out of any given set of facts.

The mass of statutes resulting from the fact that, prior to Confederation, each province had its own criminal jurisprudence caused great and increasing inconvenience. This led to the adoption of various consolidation Acts, the chief of which are the Criminal Law and Amendment Acts of 1869 and the Criminal Procedure

\* Except as otherwise credited, this Chapter has been revised in the Judicial Section, Health and Welfare Division, Dominion Bureau of Statistics.

† Revised by F. P. Varcoe, Deputy Minister, Department of Justice.

Act of 1886. These Acts dealt exhaustively with procedure in respect of indictable and non-indictable offences, jurisdiction of justices of the peace, juvenile offenders, speedy trials, criminal law, schedules and forms, etc.

In the meantime various efforts had been made in England for the reduction of the criminal law of that country into the form of a code, culminating in a draft code, submitted to the Imperial House of Commons in 1880. The question then arose as to the desirability of codifying the Canadian law. Objections were raised that codification would arrest the development of the law and its gradual adaptation to the habits and wants of the community, and would substitute a fixed, inelastic system for one which possessed the power of adjustment to circumstances. The advantages of a codification of the law of crimes were finally so manifest that a Bill founded on the English draft code of 1880, Stephen's Digest of Criminal Law, Burbridge's Digest of the Canadian Criminal Law, and on the Canadian statutory law, and introduced by the then Minister of Justice, Sir John Thompson, passed both Houses and became law July 1, 1893.

Crimes were formerly divided into two main classes: felonies and misdemeanours. A felony was a crime involving forfeiture of property and of civil rights. The Code abolished this distinction and classified offences as indictable and non-indictable. The term "indictable" means an offence which is triable on an indictment, that is to say the legal process by which a bill of indictment is preferred to, and presented by, a grand jury. An indictment differs from an information which rests only on presentation by the prosecuting authority, and properly from a presentment, which is an accusation originating with the grand jury. The word is sometimes loosely used, however, to include an information or presentment or both. Many cases of indictable offences are proceeded with, without a formal indictment. Furthermore, certain cases triable on indictment may also be disposed of summarily by a magistrate, according to the severity or circumstances of the cases.

Non-indictable offences include cases usually dealt with summarily by police magistrates under Part XV of the Criminal Code, and comprise breaches of municipal regulations and other minor offences.

According to the provisions of the Code, indictable offences are triable by jury but, in cases other than those listed below, the accused is accorded the right of election whether he be tried by jury, or before a judge without the intervention of a jury under Part XVIII of the Criminal Code, or before a magistrate under Part XVI of the Criminal Code. The jurisdiction of the magistrate is absolute, however, in certain cases and does not depend on the consent of the accused. Cases triable by jury without the consent of the accused are: treason, treasonable offences, assaults on the King, mutiny, unlawfully obtaining and communicating official information, taking of oath to commit certain crimes, seditious offences, libels on foreign sovereigns, piracy, corruption of officers employed in prosecuting offenders, frauds on the Government, breach of trust of public officers, municipal corruption, selling of appointments to any office, murder, attempt to murder, conspiracy to murder, accessory after the fact to murder, manslaughter, rape, attempt to commit rape, defamatory libel, combination in restraint of trade, for conspiring or attempting to

commit, or being accessory after the fact to any of the above offences, also for bribery or undue influence, personation or other corrupt practice under the Dominion Elections Act. Also, where an offence is punishable with imprisonment for a period exceeding five years the Attorney General may require the charge to be tried by a jury.

In the Province of Quebec a district magistrate has powers extending beyond those of a magistrate in any other province. He has the same jurisdiction as a county court judge in Ontario, and disposes of cases under Part XVIII of the Criminal Code, whereas the jurisdiction of the magistrates of other provinces extends only to Parts XV and XVI of the Criminal Code.

Capital cases for the first twelve or fifteen years after Confederation included, besides murders, death sentences for attempts at murder, piracy, treason, levying war, rape and carnally knowing and abusing any girl under the age of ten years. The list of capital offences is now: levying war, murder, piracy in cases of violence, rape, and treason. This is a drastic modification in the Code from that which obtained a century and a half ago. In 1764, according to Blackstone, there were in England 160 capital offences on the Statute Book. It is stated that there was a strong feeling against the accompanying wholesale hangings and that judges and juries resorted to all sorts of subterfuges to evade the letter of the law. The work of practical reform and modification was slow, however, owing to the opposition of the House of Lords, but the days of the indiscriminate infliction of capital punishment ended with the passage of the Reform Bill in 1832, at which time forty kinds of forgery and many less serious offences were still capital crimes.

The statistics presented in this Chapter are collected directly from the criminal courts in the different judicial districts throughout Canada. There are 150 such districts divided by provinces as follows: Prince Edward Island 3, Nova Scotia 7, New Brunswick 15, Quebec 28, Ontario 48, Manitoba 6, Saskatchewan 21, Alberta 12, British Columbia 8, Yukon 1 and the Northwest Territories 1.

## PART I.—OFFENCES OF ADULTS

### Section 1.—Total Offences

The number of charges against adult offenders dealt with by the courts in the year ended Sept. 30, 1948, was 924,711 as compared with 803,139 in 1947. Charges for indictable offences showed an encouraging decrease from 50,681 in 1947 to 48,066 in 1948, but those for non-indictable offences increased from 752,458 to 876,645 in the same comparison.

As a consequence of the fewer charges for indictable offences, convictions in this class were also lower by almost 6 p.c., while convictions for non-indictable offences were higher by about 17 p.c. as compared with 1947. The increase in convictions for all offences amounted to 15 p.c.

An analysis of total convictions per 1,000 estimated population 16 years of age or over shows that Ontario had the highest ratio in 1948 with 147.4, followed by British Columbia with 109.9 and Manitoba with 103.6.

<sup>1</sup> Nine provinces only; estimates of population 16 years of age or over are not available for Yukon and N.W.T.

**Section 2.—Indictable Offences**

The main interest in criminal statistics is concerned with the more serious offences. While such offences are much less numerous than non-indictable offences, they are more important from the standpoint of protection of the person and of property.

The highest number of convictions for indictable offences recorded in any one year was 48,107 for 1939. The number for 1948 was 13 p.c. lower than that figure and was also the lowest for the intervening years with the exception of 1942, when many men were in the Armed Forces and out of the country. The only provinces to show increases in 1948 over 1947 were Quebec, Manitoba and British Columbia.

**2.—Convictions for Indictable Offences, by Provinces, Years Ended Sept. 30, 1939-48**

NOTE.—Figures for 1900-38 are given in the corresponding table of previous Year Books beginning with the 1933 edition.

Indictable offences are divided into six classes as shown in Table 3. For Class I, which covers crimes against the person, the figures are not large but the offences are serious. Convictions in this class showed a decrease in 1948 as compared with

1947, the greater part of which was accounted for by fewer convictions for non-support and desertion, probably due to the fact that Family Courts handled many of these cases summarily rather than on indictment.

Classes II, III, IV and V each showed an increase in convictions over 1947. In Class III convictions for false pretences increased, but the figure was affected by multiple convictions; 1,626 persons had 3,667 convictions and 500 of these had an average of five convictions each. Fewer cases of car theft partly accounted for the decrease in thefts. However, the indications are that, to avoid the heavy penalty of not less than one year in gaol for theft of a motor-vehicle, the charge of "taking a car without the owner's consent" was resorted to, convictions for the latter offence increasing from 167 in 1947 to 823 in 1948. Offences against the currency (Class V) were also affected by multiple convictions; there were fewer persons with more convictions than in 1947.

Convictions for miscellaneous offences (Class VI) were 16 p.c. lower than in 1947. There were fewer convictions for driving offences but the decrease in convictions on indictment for driving a car while drunk is rather misleading since 504 cases were tried as summary convictions. The drop in convictions under the Opium and Narcotic Drug Act was the first since 1943. Of these, 83 p.c. were against Canadians, 6 p.c. were against persons born in other Commonwealth countries, and 5 p.c. against persons born in the United States. Most of the convictions were in British Columbia and Ontario.

<sup>1</sup> Offences against females include the following crimes: abortion, assault against females, assault against wife, indecent assault, carnal knowledge, incest, procuration, rape, attempted rape, seduction and wife desertion.

Table 4 classifies indictable offences by occupation, sex, marital status, educational status, age, birthplace, religion and residence. In 1948 almost 78 p.c. of these convictions were against persons who had not gone beyond elementary school grades in their education; over 55 p.c. were against persons between 21 and 40 years of age and 19 p.c. against persons over 40; 81 p.c. were against dwellers in urban districts; and 88 p.c. were against Canadian-born persons.

#### 4.—Convictions for Indictable Offences, Classified by Occupation, Sex, Marital Status, Birthplace, etc., of Person Convicted, Years Ended Sept. 30, 1947 and 1948

**Convictions of Females.**—There were fewer convictions of females for indictable offences in 1948 than in any other of the past 20 years. As compared with 1947, the only provinces reporting appreciable increases were Quebec and Manitoba. Ontario showed the most marked numerical decrease though New Brunswick and British Columbia each had a greater percentage decrease.

**5.—Convictions of Females for Indictable Offences, by Provinces, Years Ended Sept. 30, 1944-48**

Province or Territory	Numbers of Convictions					Percentages of Females Convicted to Total Convictions

**Multiple Convictions.**—The total number of convictions for any one year must not be confused with the total number of persons convicted for the same period since persons tried for indictable offences are, in many cases, convicted for more than one offence at the same trial. The trend of such multiple convictions is of value to students of sociology. They occur more often in cases of forgery and uttering, false pretences, theft, receiving stolen goods, burglary and robbery.

**6.—Persons Convicted of more than One Offence at the Time of Trial compared with Persons Convicted of One Offence, Years Ended Sept. 30, 1944-48**

**Acquittals in Relation to Convictions and Recidivism.**—The ratio of acquittals to convictions for indictable offences for the period 1944-48 averaged 13 p.c. The percentage varied greatly as between the provinces. In 1948, Nova Scotia showed the highest percentage of acquittals with Ontario second and Quebec third; New Brunswick had the lowest percentage.

The ratio of repeaters was higher in 1948 than for any of the past five years. In 1947, the percentage of second and repeated convictions was 36 while in 1948 it was 39 p.c. In these statistics, a person is considered a second offender or repeater

if convicted of two crimes or more, even though there may be only one court hearing. This tends to exaggerate the problem of recidivism, and it should be recognized that the number of convictions is affected by multiple convictions.

**7.—Charges, Acquittals and Convictions respecting Indictable Offences, Years Ended Sept. 30, 1944-48**

**Sentences.**—The proportion of fines to other types of sentence has gradually lowered in each of the past five years; in 1944 it was 41 p.c. and in 1948, 30 p.c.; as a consequence, commitments to gaol increased each year during the same period from 37 p.c. in 1944 to 45 p.c. in 1948. Penitentiary sentences remained fairly constant at 7 p.c. with a slight increase to 9 p.c. in 1948, and suspended sentences were about 15 p.c. of the total each year.

## Section 3.—Non-Indictable Offences

The statistics of this Section relate to non-indictable offences of adults disposed of by Police Magistrates or other Justices of the Peace, under authority of the Summary Convictions Act. Such convictions increased nearly 17 p.c. in 1948 as compared with 1947, and were the highest on record. Increases were general in all provinces except Prince Edward Island, New Brunswick and in the Northwest Territories.

## 11.—Convictions for Non-Indictable Offences, by Provinces, Years Ended Sept. 30, 1939-48

NOTE.—Figures for 1900-38 are given in the corresponding tables of previous Year Books beginning with the 1933 edition.

It should, however, be remembered that, while the Criminal Code undergoes little change over a period of time, the figures for summary convictions are greatly influenced by the customs of the people and by the application and degree of enforcement of municipal regulations.

In Table 12, appreciable decreases are indicated in certain types of non-indictable offences in recent years. For instance, "exercising various callings without licence" has decreased steadily during the past three years. Summary convictions for offences against gambling Acts were only one-third of the number in 1944. Possession of a radio without licence decreased somewhat in 1948 as compared with 1947 but was still high as compared with 1944. The sharp decrease in convictions for vagrancy in 1948 was probably accounted for by the increase in convictions for disturbing the peace.

On the other side of the picture, convictions against bawdy-house frequenters jumped from 373 in 1947 to 1,111 in 1948, the highest since 1943. This increase was almost entirely recorded in the Province of Quebec. As mentioned on pp. 259-60, many cases of non-support and neglecting children are now tried in the Family or Domestic Courts as summary convictions rather than on indictment. As a result, summary convictions for this offence increased by 55 p.c. in 1948 over 1947. Breaches of municipal by-laws have grown steadily during the past five years, being 75 p.c. higher in 1948 than in 1944. Breaches of the Game and Fishing Acts also increased 91 p.c. in the five-year period and breaches of the Lord's Day Act and the Railway Acts by over 50 p.c. each.

**Breaches of Traffic Regulations.**—Each year convictions for breaches of traffic regulations constitute a greater proportion of the total convictions for non-indictable offences; in 1948 they amounted to 74 p.c. The 21 p.c. increase in convictions for breaches of traffic regulations in 1948 over 1947 accounted to a great extent for the over-all increase in convictions for all non-indictable offences.

### 13.—Convictions for Breaches of Traffic Regulations, by Provinces, Years Ended Sept. 30, 1939-48

NOTE.—Figures for 1900-38 are given in the corresponding tables of previous Year Books beginning with the 1933 edition.

For the year 1948, Ontario, which had 43 p.c. of the registrations of motor-vehicles in Canada, had 54 p.c. of the total convictions for breaches of traffic regulations; Quebec in the same year had 17 p.c. of the motor-vehicles and 27 p.c. of the convictions. In interpreting the figures in this way, however, it should be pointed out that traffic regulations are by no means uniform throughout Canada and no account is taken of the differences in the degrees of urbanization in the provinces. Thus, the above two provinces have large urban centres, while in provinces with lower degrees of urbanization such as the Maritimes, Saskatchewan and Alberta, convictions are low in proportion to the number of motor-vehicles registered.

### Convictions for Drunkenness and Offences against the Liquor Acts.—

The 1947 and 1948 figures for such convictions are somewhat out of line with those for previous years, due to a change in method of compilation. The compilation, previously done by the Dominion Bureau of Statistics, was turned over in 1947 to the local court officials and now consists of the total number of convictions for each offence tabulated by the disposition of the case. Offences recorded against the Liquor Control Act include such infractions as the unlawful possession or the unlawful sale of liquor but exclude cases of drunkenness, a distinction that can be made more accurately by the local court officials.

### 14.—Convictions for Drunkenness, by Provinces, Years Ended Sept. 30, 1939-48

NOTE.—Figures for 1900-38 are given in the corresponding tables of previous Year Books beginning with the 1933 edition.

Alcoholic liquors were generally sold under specified conditions by licensed hotels or licensed shops until the First World War. During that War prohibition was established generally but, in more recent years, the Provincial Governments have taken over the sale of liquors through liquor commissions.

A possible reason for the slight decrease in offences against the liquor Acts in 1948 is the separate listing of breaches under the Indian Act, most of which have to do with liquor. Previous to 1948, such offences were compiled under the liquor Acts or under drunkenness.

### 15.—Convictions for Offences against the Liquor Acts, by Provinces, Years Ended Sept. 30, 1939-48

NOTE.—Figures for 1900-38 are given in the corresponding tables of previous Year Books beginning with the 1933 edition.

**Convictions of Females.**—The number of convictions against females for non-indictable offences has increased steadily each year since 1944, the increase in 1948 over 1947 amounting to 50 p.c. Only two provinces, New Brunswick and Saskatchewan, recorded decreases in 1948 from the previous year. In British Columbia the number of convictions was more than doubled, though some 90 p.c. of this increase was due to infractions of traffic regulations. Ontario convictions increased by 62 p.c., Prince Edward Island by 51 p.c. and Nova Scotia by 22 p.c.

Breaches of traffic regulations accounted for most of these convictions, numbering 36,593 in 1948 as compared with 18,698 in 1947. Drunkenness came next with 4,742, a small increase of 139 over 1947. Infractions of the liquor Acts showed a reduction from 1,524 in 1947 to 1,390 in 1948, and convictions recorded as vagrancy were down 33 p.c. Minor infractions of municipal by-laws accounted for almost 7 p.c. of the total in 1948.

## Section 4.—Appeals

In the calendar year 1948, 12 p.c. of the appeals in indictable cases resulted in the convictions being quashed. Appeals were dismissed in 66 p.c. of the cases, and new trials were directed in 7 p.c. of the cases while 16 p.c. of the sentences were varied. In non-indictable cases 53 p.c. of the appeals were dismissed, 36 p.c. of the convictions were quashed and 11 p.c. of the sentences were varied.

## PART II.—OFFENCES OF YOUTHS

**Indictable Offences.**—In 1948 more than one-third (40 p.c.) of all indictable crimes were committed by young people between the ages of 16 and 24 years. As this age group includes the most daring offenders and at the same time those most likely to profit by education and training, it seems worthwhile to give consideration to it as distinct from the confirmed or older offenders groups. Where proper segregation in reformatories and penitentiaries is possible young offenders will be found more often in the open reformatories or institutions conducted on the Borstal system.

Offenders in this age group, although comprising only about 16 p.c. of total population over 16 years of age, were responsible in 1948 for 67 p.c. of the crimes of burglary and robbery, 45 p.c. of all cases of damage to property without violence and 49 p.c. of the malicious damage to property including arson.

**1.—Convictions against Youthful Offenders for Indictable Offences, by Age Groups for each Class, Years Ended Sept. 30, 1946-48**

1948	292	74	355	25	1,076	93	1,723	192

In 1948 as compared with 1947, convictions against young men of from 16 to 24 years of age decreased in each class shown in Table 2, with the exception of "Other offences". The small increase in that group was accounted for by more convictions for dangerous and reckless driving and offences against public morals. On the other hand, convictions against females in the same age group increased in all but two of the classes shown. The largest increase was that of 25 p.c. for "offences against property without violence", caused by more convictions for false pretences and theft.

More convictions were recorded for theft than for any other offence and 925 of the 6,014 thefts were of motor-vehicles. Such offences as the latter often lead to the more serious crimes of robbery and burglary, which were the next most frequent. Theft, too, is the most common cause for bringing young women before the courts on indictment, though with them theft of cars is almost negligible. Offences common to young males tend towards those requiring physical strength and daring but young women are given to offences that require mental agility and cunning, such as false pretences, forgery and uttering forged documents.

**Non-indictable Offences.**—Since offences in this category are not reported by age of offender, it is not possible to segregate those committed by young people between the ages of 16 and 24 years.

### PART III.—JUVENILE DELINQUENTS

The Juvenile Delinquents Act defines a child as “any boy or girl apparently or actually under the age of 16 years”. Provision is made, however, by which the Governor General in Council may proclaim that in a province the definition of a child be a “person under the age of 18 years”. This has been done in British Columbia, Alberta, Manitoba and Quebec. For uniformity the figures relating to juveniles compiled by the Dominion Bureau of Statistics refer to the younger ages of under 16 years only and deal primarily with cases disposed of by the courts. The fact that juvenile court statistics furnish the most comprehensive figures collected on a country-wide basis makes it important that their possibilities and limitations be understood.

It is impossible to give a complete picture of juvenile delinquency for the reason that many instances of minor offences are not detected while others are settled by the police, by social agencies or school authorities without the necessity of apprehending the child. This is particularly true in rural districts where the courts are not readily accessible.

The number of cases brought before the courts is influenced by such factors as personnel and facilities of the court, community interest in and understanding of the function of a juvenile court, and by variations in the policies of the courts in the disposition of cases. Some courts do not consider a case “adjourned *sine die*” as a proven delinquency; other courts handle certain cases unofficially when legal papers are not prepared and the case is adjusted as an “occurrence” without a formal hearing. Furthermore, as time goes on more courts are established and the additional returns may exaggerate an apparent increase in delinquency or may underestimate a decrease.

It should be noted, too, that the figures refer to offenders rather than offences and do not represent the number of delinquent juveniles because some children may be brought to court more than once within a year (see p. 277). In the following tables, children are recorded as separate individuals each time they appear on a new complaint.

Reports of juvenile offences were received in 1948 from 129 of the 150 judicial districts; 16 reported no offences. The reporting areas were particularly representative of cities and towns, including 106 urban centres in Canada with populations of 4,000 or over.

### Section 1.—Total Delinquents

The terms 'indictable' and 'non-indictable' are applied only to offences of adults. Similar offences committed by juveniles are termed 'major' and 'minor' offences, respectively.

The number of cases of juvenile delinquency brought before the courts has declined steadily each year since 1942, when the peak was reached. The decrease in 1948 as compared with 1947 amounted to 5 p.c. and was shared by all provinces with one exception; the increase in Nova Scotia was very small.

In 1948 there were 5,049 children brought before the courts for major offences as compared with 5,152 in 1947, and 2,829 charged with minor offences as against 3,113 in 1947.

#### 1.—Juveniles brought before the Courts, by Provinces, Years Ended Sept. 30, 1944-48

The peak in delinquency among girls was reached in 1943, a year later than for boys, followed by declines in numbers for both sexes. The ratio between boys and girls charged in court shows a gradual up-grading for the girls until 1946. The actual number of girls appearing in court in 1948 was the lowest since 1939.

## 2.—Ratio of Boys and Girls brought before the Courts, Years Ended Sept. 30, 1939-48

Year	Boys		Girls		Total Charges

## Section 2.—Major Delinquencies

Convictions of juveniles for major offences have declined considerably since 1942, the peak year. The number for 1948 was the lowest since 1924.

## 4.—Convictions of Juveniles for Major Offences, by Provinces, Years Ended Sept. 30, 1939-48

NOTE.—Figures for the years 1933-38 are given at p. 254 of the 1947 Year Book.

Year	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Yukon and N.W.T.	Canada
1939.....	45	228	244	1,245	2,164	293	201	321	277	—	5,018

1947.....	29	316	248	951	1,861	357	197	225	482	17	4,683
1948.....	27	329	203	959	1,944	296	160	199	463	11	4,591

Offences against property made up 93 p.c. of the total convictions for major delinquencies in 1948, more than one-half of these, or 52 p.c. of the total, were offences against property without violence. All thefts without violence are included in this group. Offences against property with violence (burglary, breaking and entering) were on the increase until 1944, but have decreased to 1,229 in 1948, the lowest figure since 1939. Such convictions made up 27 p.c. of the total in 1948. Offences against the person, which averaged 3 p.c. of the total convictions for major offences in the period 1939-47, accounted for 4 p.c. in 1948.

**5.—Convictions of Juveniles for Major Offences, by Classes of Offence and Ratios per 100,000 Population 7-16 Years of Age, Years Ended Sept. 30, 1939-48**

1948.....	202	11	1,229	64	2,400	124	640	33	15	1	105	5	4,591	238

**Sex and Age of Delinquents.**—Juvenile delinquents are predominantly boys. Of all those appearing in court in 1948 for major offences, 4.9 p.c. were girls, a slightly higher percentage than in 1947. Over the ten-year period 1939-48, the ratio of girls to boys has averaged about 1 to 22.

**6.—Convictions of Juveniles for Major Offences, by Offence and Sex, Years Ended Sept. 30, 1944-48**

**Education and Delinquency.**—Assuming that six years is the age for entering Grade I, 46 p.c. of the girls and 49 p.c. of the boys convicted of major offences in 1948 were two years or more behind the normal grade for their age, while 3 p.c. were a year or more in advance of the usual grade for their age. More than one-half the juvenile delinquents were in Grades V, VI and VII and 9 p.c. were known to have attended high school for some period of time.

**Repeaters.**—Experience, which dispels or increases resentment to authority, may be a factor in encouraging or deterring repeaters. Some of the responsibility for the attitude that is built up, be it good or bad, rests on the police, the probation officer, the staff of the detention home and the judge. The recollection of how he was picked up the first time, how he was handled while awaiting hearing, the opinion of those in whose care he was placed during the process of readjustment, all make an impression on a child.

Over the ten-year period, 1939-48, approximately one in every four children brought before the court for major offences failed to heed the first warning of the court and made at least a second appearance. In 1948, 73 p.c. of the delinquent children were brought before the court for the first time, 15 p.c. were second offenders, 6 p.c. third, 3 p.c. fourth and 4 p.c. were dealt with by the courts five or more times.

**Disposition of Cases of Major Delinquents.**—The disposition of cases by the various courts depends on the practices within the courts and on the facilities for court supervision, for institutional care and other services for delinquent children. Practices may vary between courts or from year to year in the same court but generally the disposition of cases remains much the same. Placing the child on probation of the court or of his parents and suspended sentences accounted for more than one-half of the disposition of cases for major offences in 1948. The cases sent to training schools represented 14 p.c.

## Section 3.—Minor Delinquencies

Convictions for minor offences, like those of major offences, have declined steadily since 1942. In 1948, 29 p.c. of the boys and girls brought to court for minor misdemeanours were charged with incorrigibility. Bicycle infractions were the next most numerous for both boys and girls, accounting for 16 p.c. of the total. For boys, disorderly conduct and vagrancy came third numerically, and for girls it was truancy; the latter offence was fourth for boys.

### 11.—Convictions of Juveniles for Minor Offences, by Types of Offence, with Percentages of Total Minor Convictions, Years Ended Sept. 30, 1939-48

NOTE.—Figures for the years 1922-36 are given at p. 261 of the 1947 Year Book and for 1937-38 at p. 295 of the 1948-49 edition.

**Disposition of Cases of Minor Offences.**—The disposition of juveniles brought to court for minor offences is proportionately the same as that for major offences. In 1948, more than one-half of these juveniles were reprimanded, allowed to go home or the final disposition of their cases was suspended; 29 p.c. were fined and 19 p.c. committed to training schools.

**12.—Disposition of Delinquents Convicted of Minor Offences, with Percentages of Total Minor Offences, Years Ended Sept. 30, 1939-48**

## PART IV.—POLICE FORCES\*

The Police Forces operating in Canada are organized under three groups: (1) the Federal Force, which is the Royal Canadian Mounted Police and whose operations cover a very wide field in addition to purely police work; (2) the Provincial Police Forces—the Provinces of Ontario, Quebec and British Columbia have organized their own Provincial Forces, but the other provinces engage the services of the Royal Canadian Mounted Police to perform parallel functions within their boundaries; (3) the Municipal Police—every city of reasonable size employs its own police organization which is paid for by the local taxpayers and which attends to purely police matters within the borders of the municipality concerned.

The organizations under these three headings are described in turn below.

### Section 1.—The Royal Canadian Mounted Police†

The Royal Canadian Mounted Police is a Civil Force maintained by the Federal Government. It was organized in 1873 as the North West Mounted Police, whose duties were confined to what was then known as the North West Territories. By 1904, the work of the Force received signal recognition when the prefix "Royal" was bestowed upon it by King Edward VII. In 1905, when Alberta and Saskatchewan were constituted Provinces, an arrangement was made whereby the Force continued to discharge its duties as formerly, each province making a contribution towards defraying the cost. This was continued until 1917.

\* The material under this heading has been obtained through the courtesy of Commissioner S. T. Wood, C.M.G., of the Royal Canadian Mounted Police. Section 2, dealing with Provincial Police Forces, was submitted to Commissioner Wood by Geo. A. Shea, O.B.E., Secretary-Treasurer, Chief Constables' Association of Canada.

† Since this material was submitted, the Royal Canadian Mounted Police took over the duties of the former British Columbia Provincial Police on Aug. 15, 1950.

In 1918, the Royal North West Mounted Police was assigned the duty of enforcing Dominion legislation for the whole of Canada west of Port Arthur and Fort William. Soon after the end of the First World War, an extension of governmental activities made it obvious that the enforcement of Dominion statutes throughout Canada must be the responsibility of a Dominion Force and, therefore, the jurisdiction of the Royal North West Mounted Police was extended to the whole of Canada early in 1920. In that year, the name of the Force was changed to the Royal Canadian Mounted Police and the former Dominion Police with Headquarters at Ottawa, whose duties were largely connected with guarding public buildings in that city and the Canadian Government dockyards at Halifax, N.S., and Esquimalt, B.C., were absorbed by the Royal Canadian Mounted Police.

**Organization.**—The Force is controlled and administered by a Minister of the Crown (the Minister of Justice). Its Commissioner has the rank and status of Deputy Minister. Officers are commissioned by the Crown and for many years have been selected from serving non-commissioned officers. The Force is divided into 15 Divisions, including the Province of Newfoundland and the Marine Division, and has 470 Detachments distributed over the entire country. Its land force transportation consists of over 800 motor-vehicles, most of which are fitted with two-way radio sets connecting with wireless stations operated by the Force. Such stations operate in both western and eastern Canada including the Quebec-United States boundary area. Its air transport consists of seven aircraft of various types. The present (August, 1950) strength of the Force is approximately 3,500 officers and men, with a reserve strength of about 300. The reserve strength is located chiefly in the larger cities where men can be congregated easily and where instruction can be given in the evenings.

The Marine Division has a total strength of 213 officers and men and operates 21 ships of various kinds, the majority of which are located on the Atlantic Coast and on the Great Lakes. The R.C.M.P. schooner *St. Roch*, which has been used as a floating detachment in the Far North and as a supply ship to isolated detachments, is the only ship to navigate the Northwest Passage from east to west and from west to east. It was recently transferred from Esquimalt, B.C., to Halifax, N.S., via the Panama Canal, the only vessel to have circumnavigated the North American Continent.

The Personnel Branch of the R.C.M.P. has officers in each Division across the country. Great care is taken in the selection of recruits.

**Duties.**—The Royal Canadian Mounted Police has the responsibility for enforcing federal laws throughout Canada and is specially empowered to deal with infractions against smuggling by sea, land and air. It also enforces the provisions of the Excise Act, and is responsible for the suppression of traffic in narcotic drugs. In all, the Force has responsibility in over 50 Federal Government Acts including the Indian Act. It also assists many departments of the Federal Government in administrative duties and is responsible for the protection of government buildings and property and some of the more important dockyards. It is the sole police force operating in the Northwest Territories and Yukon. Furthermore, it undertakes secret and security services for the Federal Government. In addition to its federal duties, the Force has agreements with the Provinces of Alberta, Saskatchewan, Manitoba, New Brunswick, Nova Scotia and Prince Edward Island, whereby the services of the Royal Canadian Mounted Police can be secured to enforce provincial laws and the Criminal Code in rural districts upon payment for

such services. The agreement with Saskatchewan has been in existence for 22 years and those with the other provinces for 18 years. The Force has also agreements for policing more than 70 urban centres within those six provinces; this service cannot be extended at the present time.

**Other Services.**—The services of R.C.M.P. experts in fingerprints, crime index information, examination of firearms and questioned documents are available to all other police forces in Canada. A Police Gazette, issued monthly and containing instructional articles on police work as well as the latest information on persons wanted and missing persons, is sent to all police forces across the country. The R.C.M.P. has two Police Colleges which are open to selected personnel from other police forces in Canada and to a more limited number of those outside its boundaries.

In recent years the Force has given special attention to crime prevention, as well as detection, and has done much to assist the youth of Canada in developing a healthful outlook towards the police, law, order and responsible citizenship. Personal contacts with over a million young people have been made through school and youth groups supervised by churches and service clubs.

A book entitled "Law and Order in Canadian Democracy", containing twenty lectures, has recently been issued by the Force together with other essays for the instruction of the youth of the country.

## Section 2.—Provincial Police Forces

**Quebec Provincial Police Force.**—The Quebec Provincial Police Force is responsible for upholding law and order over the whole territory of the Province, from the provincial boundary between Ontario and Quebec to the Magdalen Islands in the Gulf of St. Lawrence.

This Force, composed of about 700 men, is in charge of a Director who acts under direct orders from and is responsible to the Attorney-General of the Province.

To facilitate operations, the territory is divided into two almost equal parts designated as the District of Montreal and the District of Quebec. The Director has his office at Montreal and an Assistant Director in the city of Quebec. Working under these Directors are two deputies and an Inspector General.

In each District the Police Force is divided into three sections: the detective corps, the constabulary and the traffic officers, each of which is in charge of a captain supported by a number of lieutenants and sergeants. This Police Force, which for years has enjoyed an enviable reputation for the successful policing of Quebec's highways and for its efficiency in solving crimes, has been in course of reorganization for the past three years. During this time, the highway motorcycle patrol has been gradually replaced by a fleet of automobiles which have proved much more efficient, especially during the winter months.

A province-wide frequency modulation radio-communication system has been established at Montreal. A main station, operating on the top of Mount Royal, directs radio-equipped cars within a radius of between 60 and 80 miles around Montreal, and similar stations operating from the cities of Quebec and Three Rivers direct the mobile units operating in their respective areas. Sub-stations operate at each of the eight bridges giving access to or exit from the city of Montreal itself and a number of cars, all equipped with frequency modulation three-way radio units, patrol the surrounding country day and night.

The Quebec Provincial Police Force, well trained and alert, is in a position to provide the citizens of the Province with the protection they have a right to expect from it.

**Ontario Provincial Police.**—The Ontario Provincial Police is maintained by the Government of the Province of Ontario under the Attorney-General's Department. The Force is responsible for law enforcement in the rural and unorganized parts of the Province, and in certain municipalities by contract.

The development of the Force from its beginnings in the early years of Confederation to passing of the Police Act, 1946, is outlined at p. 332 of the 1950 Year Book.

At present the Force, with a strength of approximately 1,092, consists of a General Headquarters at Toronto and 16 Districts with headquarters at Chatham, London, Dundas, Niagara Falls, Aurora, Mount Forest, Barrie, Peterborough, Belleville, Perth, Cornwall, Haileybury, Sudbury, Cochrane, Port Arthur and Kenora. Each District has detachments adequate to meet law-enforcement requirements. A Criminal Investigation Branch of the Force, under the command of a Chief Inspector, is maintained at Toronto. This Branch investigates crimes of a major nature. The installation of one of the largest police frequency modulation radio systems in the world has placed at the command of the police a most efficient method of combating every type of lawlessness.

There are in operation 47 fixed stations and 351 two-way radio cruisers. The 250-watt stations at District Headquarters are open 24 hours daily and many of the cars are on continuous round-the-clock patrols.

Up to July, 1950, 75 municipalities have availed themselves of the provisions of the Police Act for the policing of their municipalities by the Ontario Provincial Police.

**British Columbia Provincial Police.\***—The history of the British Columbia Provincial Police, the organization of which followed the influx of gold seekers in 1858, is given briefly at p. 333 of the 1950 Year Book.

The present strength of the Force is 530 all ranks. For administrative purposes, the Province is divided into 12 police Districts, each under the command of an Officer. A Criminal Investigation Branch is operative at Headquarters together with a training school. Short-wave radio is used extensively connecting 23 key stations throughout the Province and eight police boats patrolling the coast are also equipped with short wave and voice transmission.

Provincial Police also assist Federal as well as Provincial Departments seeking their aid and municipalities in 1925 were afforded the opportunity to contract Provincial Police Protection; 45 cities have signed these contracts.

The Provincial Police contributes invaluable help to youth activities. Talks are given on such subjects as behaviour, good citizenship, traffic safety, firearms and explosives, camping and camp precautions, first aid, etc. Voluntary assistance is also rendered to promote sports and games, and youth organizations call upon individual members of the Provincial Police for instruction.

---

\* As mentioned in the footnote on p. 279, the Royal Canadian Mounted Police took over the duties of the British Columbia Provincial Police on Aug. 15, 1950.

Police vehicles on the Lower Mainland and southern Vancouver Island are all equipped with three-way radio. New units are either in the process of installation or planned in many other sections of the Province.

Linked in with this system is a police plane, a six passenger DeHavilland "Beaver" equipped with floats.

### Section 3.—Municipal Police Statistics

In 1948 police statistics were collected from 197 urban centres of 4,000 or over (covered in Table 1), 14 district municipalities and 3 unorganized districts of 4,000 population or over. The aggregate population of these centres was 5,317,752 (1941), the total number of policemen in 1948 was 8,069 or one for every 659 of the population.

A total of 960,709 offences were reported to the police, 154,214 arrests were made and 672,021 summonses were issued. More motor-vehicles were reported recovered (8,895) than stolen (8,665). This happens when the stolen vehicle is recovered before the owner has missed it or a lost car of a previous year is found in the current year. Of the 16,558 bicycles reported stolen, 14,036 were found. The value of other stolen goods reported was \$4,817,863 and the value of stolen goods recovered \$2,573,680.

In the 80,862 motor-vehicle accidents investigated, 608 persons were killed and 19,579 injured. In other accidents reported, 730 persons were killed and 9,509 injured. Persons given shelter in police stations numbered 79,567 and 8,181 missing persons as well as 10,925 stray children were found.

## PART V.—PENITENTIARIES AND REFORMATORIES

Penal institutions may be classified under three headings: (1) penitentiaries, with slow turnover since prisoners have long sentences; (2) reformatories and training schools, also with rather slow turnover; and (3) common gaols, where the turnover is extremely rapid. If the average population for the year be taken as the average of the figures for inmates at the beginning and at the end of the year, and the number discharged as the turnover, the turnover in 1948 was: in penitentiaries, 47 p.e.; in reformatories and training schools, 276 p.e.; and in gaols, no less than 1,591 p.e. In dealing with these figures it should be borne in mind that the common gaol population changes from day to day and is partly made up of accused persons awaiting trial who may be either liberated or sent to a penitentiary or reformatory.

<sup>1</sup> Does not agree with figure at end of previous year because of changes in reporting procedures, transfers to other institutions, etc.

### Section 1.—Penitentiaries\*

The Penitentiaries Branch of the Department of Justice is charged with the administration of the various penitentiaries of Canada. Seven institutions are included in the system, the two largest of which are at Kingston, Ont., and St. Vincent de Paul, Que. The other five are at Dorchester, N.B.; Prince Albert, Sask.; Stony Mountain, Man.; New Westminster, B.C.; and Collins Bay, Ont. During the year ended Mar. 31, 1949, the average daily population of these institutions was 3,989 and the total net cash outlay for the year was \$4,708,659 or \$3.23 per convict per diem, compared with 3,028 average daily population and \$2,689,059 total cash outlay or \$2.43 per convict per diem for 1941.

Females given penitentiary sentences in the different provinces are sent to the penitentiary at Kingston, Ont., where special quarters and staff are maintained for their detention and supervision. Female convicts in custody on Mar. 31, 1949, numbered 85 compared with 43 in 1944 and 46 in 1941.

\*Revised by the Superintendent of Penitentiaries, Department of Justice.

**The Ticket-of-Leave System.**—The parole system in Canada is legalized under the Ticket-of-Leave Act (R.S.C. 1927, c. 107) and is administered by the Minister of Justice. It is described in detail at pp. 305-308 of the 1948-49 edition of the Year Book.

## Section 2.—Reformatories and Training Schools

A census of reformatories and training schools is taken at five-year intervals, the latest being for June 1, 1946. At that date there were 28 such institutions in Canada. The 25 institutions that reported had a total inmate population of 3,662, of whom 2,930 were males and 732 were females. The males were confined in 13 institutions and the females in 12. A table showing inmates by age groups is given at p. 340 of the 1950 Year Book.

Reports on movement of population are received yearly from penal institutions and training schools. These figures are given for the years 1945-48 in Table 1, p. 286.

## PART VI.—CRIME AND DELINQUENCY IN NEWFOUNDLAND

Statistics of criminal and other offences in Newfoundland will not be included in the regular tables until such time as the Criminal Code of Canada comes into effect in that Province. By June, 1950, legislation had been passed establishing seven district courts but no appointments had as yet been made.

The Newfoundland Constabulary polices the city of St. John's and 40 outpost stations including all the major settlements of the Island. The Newfoundland Ranger Force covers the remainder of the Island and Labrador.

**Offences of Adults.**—Prosecutions and convictions of adults for indictable and non-indictable offences in 1948 and 1949 are shown in Table 1.

## 1.—Prosecutions and Convictions against Adults, in Newfoundland, 1948 and 1949

	No.
Investigations.....	1,216
Completed.....	1,007
Under investigation.....	209
Prosecutions.....	851
Convictions.....	799
Dismissed.....	52

**Juvenile Delinquencies.**—The St. John's Juvenile Court was established on Jan. 23, 1945, under the provisions of the Welfare of Children Act (No. 57 of 1944), and the territorial limits of the jurisdiction of the Judge of the Juvenile Court were defined as the Electoral Districts of St. John's East and West. Cases of juvenile delinquency occurring outside of these limits are dealt with by the magistrate who has powers similar to those of the Judge of the Juvenile Court for disposing of these cases under the provisions of the Welfare of Children Act.

During the year ended Mar. 31, 1949, 147 children appeared in court. Five cases were adjourned *sine die*, 16 were dismissed and 126 found delinquent.

## PART I.—FORMAL EDUCATION\*

### Section 1.—Education in the Provinces

Education in Canada is the responsibility of the provinces. Each has its own system and Quebec has two. However, there are two clearly defined types: (1) English-Canadian tradition carried on in the nine English-speaking provinces and in the Protestant schools of Quebec and (2) the French-Canadian tradition followed in the Roman Catholic schools of Quebec.

**The English-Canadian Tradition.**—The system of education in each province is established by legislation and administered by a Department of the Provincial Government under a Minister of Education who is a member of the Cabinet and is responsible to the Legislature.

Each of the Atlantic Provinces† has a Council of Public Instruction or Board of Education, an advisory group composed of the Premier, Minister of Education, Deputy Minister or Superintendent and certain other appointees. This Council in Newfoundland is made up of the Minister, Deputy Minister and the Chief Executive Officer for each of the four leading religious denominations.

Each Department of Education is concerned with the general administration of the public schools, the conduct of examinations, the certification of teachers, the registration of private schools and trade schools, public and travelling libraries, correspondence courses and also the direct management and control of teacher-training schools, vocational institutes and schools for the blind and the deaf.

\* Except where otherwise indicated, this Part has been prepared in the Education Division, Dominion Bureau of Statistics.

† Newfoundland, Prince Edward Island, Nova Scotia and New Brunswick.

Direct control and operation of the public schools is in the hands of local boards of school trustees, usually elected for terms of two or three years. They employ the teachers and administer the revenues received from provincial grants, local taxation and other minor sources. Any fees charged are for secondary education and are merely nominal.

Elementary and secondary education extends over 12 or 13 years or grades depending on the province. The elementary grades terminate with Grade VIII and the secondary grades begin with Grade IX though there is a practical as well as a theoretical separation into three divisions: Primary (Grades I to VI); Intermediate (Grades VII to X); and Senior (Grades XI and XII or XIII). The elementary schools are known as public schools, the secondary schools as high schools. However, many public schools teach some secondary grades and in Prince Edward Island and Newfoundland all grades are taught in the public schools.

In the cities and in some smaller centres there are kindergarten classes for five-year-olds and a few for four-year-olds as part of elementary education. Most children begin Grade I at age six or early seven and many complete the eight grades in seven years. Attendance is compulsory from age seven or eight to age 14 with attendance to age 16 required of urban pupils in some provinces. Emphasis is on the fundamental subjects—reading, writing, arithmetic, health and social studies—with varying additions of science, arts and crafts, music, home economics and shopwork. Many pupils, particularly in rural areas, leave school at the end of elementary schooling and enter employment in agriculture or unskilled occupations.

Secondary education may extend over a period of four or five years. Courses and subjects of study are diversified. A student may choose the academic course leading to university entrance or select courses or subjects preparing for employment in agriculture, commerce or industry. A student may pass from secondary school into commerce or industry at any time during this period provided he or she is over the compulsory age limit.

Several avenues for further training are open to the high-school graduate: normal school training of one year for elementary school teachers; specialized technical training extending up to two years in a technical institute—there is at least one such institute in every province; nurse-training school where training extends over three years; or university. University courses are available in all branches of arts, commerce, science, education, philosophy, medicine, theology, etc. Graduation with a first degree (B.A., B.Sc., etc.) requires four years, medicine requires six years and theology seven years. Post-graduate courses require another two or more years.

**The French-Canadian Tradition.**—The Quebec Department of Public Instruction is represented in the Cabinet by the Provincial Secretary. Although the Superintendent of Public Instruction is the head of the Department, a Roman Catholic Committee and a Protestant Committee, in charge of the education of Roman Catholics and Protestants, respectively, constitute the Council of Education which formulates policy and superintends the administration of all educational matters. The Council, however, has no authority over many special and technical schools which come directly under various Government Departments.

From the very beginning boys are separated from girls. Both sexes follow through the Primary Grades, I to VII. The girls may then take the Intermediate Grades, VIII and IX, and from there enter a regional household science school,

begin a four-year course in normal school or enter a superior school where a two-year course leads to a school of fine arts, a commercial course or a nurse-training course.

At the end of the fifth year a boy may enter a classical college for an eight-year course ending with a baccalaureate degree which is prerequisite for entrance to a professional course in university. Or he may continue on to the end of the primary course and then spend two years in the complementary course. From this point he may enter a technical school or any one of four sections of the two-year superior course—commercial, scientific, agriculture, technical or pre-normal school. The latter leads to entrance to a normal school, the others lead to specialized schools and advanced courses in technical schools or, after another year of preparatory work, to the higher schools of applied science, commerce and agriculture affiliated with the universities.

The boy who neither enters the classical college nor goes on to the complementary course may go directly from the primary course to a trade school or one of the regional agriculture schools. These schools offer two-year terminal courses.

## Section 2.—Education in the Territories\*

**The Northwest Territories.**—The Department of Resources and Development is responsible for education in the Northwest Territories. The education of white, Indian, Eskimo and half-breed children is carried on at Territorial and Indian day schools, which are completely maintained by the Federal Government, and at residential and mission day schools operated by the Church of England, the Roman Catholic Church, and the Northern Canada Evangelical Mission. The Federal Government assists these latter schools by annual operational grants, by grants for the maintenance of native children and the children of destitute white and half-breed parents, and by furnishing school supplies and equipment.

Only one school in the Northwest Territories is maintained chiefly by local taxation and administered by a local school board, though it too, receives an annual grant from the Federal Government. It is the modern eight-classroom elementary and high school at Yellowknife which serves all the children of Yellowknife and the more advanced pupils residing at other settlements in the Territories. The schools of the Mackenzie District, which comprises the western portion of the Northwest Territories, are inspected periodically by a superintendent of education whose office is at Yellowknife.

Territorial day schools are located at Port Brabant, Aklavik, Fort Simpson, Fort Resolution, Coppermine, Port Radium, Fort Smith, Lake Harbour on Baffin Island, and Coral Harbour on Southampton Island. Indian day schools are located at Fort Norman, Fort McPherson, Arctic Red River, Fort Franklin, Fort Rae, Rocher River, Hay River, and Fort Good Hope. The Church of England operates a residential and a day school at Aklavik and the Roman Catholic Church operates residential schools at Aklavik, Fort Providence, and Fort Resolution. Day schools are also operated by the Federal Government at Fort Chimo and Port Harrison in the Province of Quebec. These schools are located in Eskimo territory on the Arctic coast of Quebec, in which region the Federal Government is responsible for the administration of Eskimo affairs.

\* Prepared under the direction of H. L. Keenleyside, Ph.D., Deputy Minister, Department of Resources and Development.

The education of Eskimo children is one of the problems of the far north. In the Eastern Arctic, Eskimo children are given some education at mission day schools. Because of their nomadic way of life, however, Eskimos seldom remain long at the settlements and the periods available to the missions for teaching the children are comparatively short. The Eskimos of the Eastern Arctic have long had a system of syllabic writing (expressed as geometric phonetic characters) which most of them can now read and write proficiently. Syllabic writing has been used successfully to provide educational material in the Eskimo language, giving advice on health matters, hygiene, and native economics for the benefit of both children and adults. With the establishment of schools in Eskimo Territory it is hoped that the Eskimos will learn, in due course, to understand simple English and be able to speak and read it.

The Department of Resources and Development recently initiated a program designed to improve educational and welfare facilities generally in the Northwest Territories. The program included the inauguration of an extensive circuit for the regular distribution of educational films, special radio broadcasts to classrooms, the provision of additional equipment and supplies, increased attention to methods of instruction, and the establishment of new day schools in areas where need exists. The new schools are being staffed by a particular classification of welfare teachers, who carry on welfare work in the communities in addition to regular teaching duties.

The schools in the Mackenzie District follow the program of studies for the elementary and secondary schools as authorized by the Alberta Department of Education. A modified elementary school curriculum, suitable for the unique needs of schools in the Arctic regions, is under consideration. In the remote areas, elementary and high-school students have access to correspondence-course studies issued by the Alberta provincial educational authorities.

Educational standing obtained in the Yellowknife High School compares favourably with that awarded in high schools in Alberta and is accepted by universities throughout Canada.

**Yukon.**—In Yukon, schools for the education of white and half-breed children are maintained by the Territorial Government. Public schools are operated at Dawson, Mayo, Whitehorse, Carcross, Teslin, Brook's Brook, Swift River, and Destruction Bay. The three last-named schools are one-room buildings, located on the Alaska Highway. In addition, St. Mary's Separate School at Dawson operates as a day school, and the Convent of Christ the King at Whitehorse operates as a residential school. The latter is also open to day pupils.

The education of native children is carried on in two types of schools. The day schools are operated by the Indian Affairs Branch of the Federal Department of Citizenship and Immigration, and the residential schools by religious denominations. Residential schools are given a per capita grant for each Indian child registered therein.

The public schools at Dawson and Whitehorse have high-school departments providing education leading to university entrance. University entrance (junior matriculation) examinations are held in June at Whitehorse and at Dawson by authority of the British Columbia Department of Education. The examination papers are forwarded from Victoria and are returned there to be graded. In outlying districts, correspondence courses are provided at a nominal cost by the British Columbia Department of Education.

The British Columbia curriculum is followed in Yukon schools. Educational matters in Yukon are in charge of a Superintendent of Schools, resident at Dawson, who is responsible to the Commissioner. Annual inspections of all schools are made by the Superintendent.

### Section 3.—Statistics of Schools, Universities and Colleges

This Section summarizes the statistics of all educational institutions in Canada (exclusive of Newfoundland) which include four types: provincially controlled schools, privately controlled schools, federal Indian schools, and universities and colleges.

#### 1.—Enrolment in Educational Institutions, by Provinces, School Year 1947-48

Population, 1948 (estimated).....	757,000	854,000	846,000	1,082,000	12,833,000 <sup>4</sup>

<sup>1</sup> Schools for the blind and deaf; these are boarding schools and many of the pupils are from provinces other than the one in which the school is situated. Based on estimates. <sup>2</sup> Courses for elementary teachers only; those for secondary teachers are included in university enrolment. <sup>3</sup> Includes 1,645 in ordinary day schools in Yukon and the Northwest Territories. <sup>4</sup> Includes 24,000 population for Yukon and the Northwest Territories.

The provincially controlled schools are the most important group and account for about 90 p.c. of the total enrolment shown in Table 1. These systems of public elementary and secondary education are financed mainly by local school authorities, assisted by provincial grants. There are private schools in all provinces (i.e., schools that are not conducted by publicly elected or publicly appointed boards and are not financed out of public money) but their enrolment is not large in comparison with that of the public schools. At the level of higher education, there is a provincial university in each of six provinces and one or more colleges supported out of provincial funds in the other provinces. In addition, there are 16 private universities most of which receive provincial aid and 163 colleges giving degree credit courses. Agricultural schools and colleges are listed at pp. 203-213 of the 1943-44 edition of the Year Book.

### Subsection 1.—Provincially Controlled Elementary and Secondary Schools\*

**Enrolment and Attendance.**—At the elementary-school level enrolments have been increasing since the school year 1944-45, except in Saskatchewan. Birth registrations of the past few years indicate that by 1953-54 the enrolment in Grades I to VIII will have increased from 1,712,662 to over 2,307,000, a total of 595,000, and there is every indication that the increase may amount to 800,000 by 1960. A decline may set in shortly after that. An increase of 800,000 is equal to over 45 p.c. of the total enrolment in the elementary schools of Canada and is 140 p.c. of the elementary enrolment of the largest province—Quebec. Grades above Grade VIII will begin to feel the effects between 1953 and 1955.

Other factors, too, are operating to increase enrolment including: the introduction of family allowances in 1945 which, while showing its effects on schools most clearly in improved attendance, is also keeping in school to the legal age limit many pupils who were leaving from a few months to two years before they were lawfully entitled to leave; increased emphasis on the holding power of schools; increased transportation facilities at public expense; the building of dormitories in some provinces; the larger unit of administration; the establishment of junior high schools and composite schools; and the wave of post-war immigration. Enrolment in provincially controlled schools is given for the latest school year available in Table 1 and average daily attendance is shown in Table 2. The average daily attendance figures are more comparable, as between provinces, and probably more significant for most purposes than those of enrolment.

\*Day and technical schools only.

### 2.—Average Daily Attendance in Provincially Controlled Schools, by Provinces, School Years Ended 1939-48

NOTE.—Comparable figures for earlier years will be found in previous editions of the Year Book, beginning with the 1932 edition.

<sup>1</sup> Excluding 410 Grade XI students and 110 Grade XII students enrolled in Prince of Wales College.

<sup>2</sup> Includes 626 pupils in independent schools.

**Teaching Staffs.**—In 1948 the teaching staffs of the publicly controlled elementary and secondary schools numbered 19,349 men and 57,911 women, a total of 77,260. Omitting Quebec for which comparable data are not available, 31 p.c. of the teachers were in cities, 28 p.c. were in one-room rural schools, 22 p.c. in towns and villages and the remaining 19 p.c. in schools of two or more rooms outside of urban centres. The proportion of men teachers is increasing and in 1948 reached 27 p.c., a little short of the pre-war level of 30 p.c. Again omitting Quebec where 36 p.c. of the teachers are members of religious orders, approximately 25 p.c. of the women teachers are married. Throughout the nine provinces at least 10 p.c. of the total number of teachers are untrained or only partially trained, also about 10 p.c. of the total staff leave the profession each year. During the 1947-48 school year there was an increase of \$243 in the median salary (see Table 4) for teachers in the eight provinces (Quebec excluded). The classification of teachers, their teaching experience and rates of salary paid are given in the Dominion Bureau of Statistics report “Teachers’ Salaries and Qualifications in Eight Provinces, 1948”.

**4.—Teachers in Provincially Controlled Schools Classified according to Salary, by Provinces, School Year 1947-48**

**Financial Support.**—The income required to support the public elementary and secondary schools is derived almost wholly from local taxation and provincial grants. Fees for elementary schooling may be charged in Quebec. In some of the other provinces fees are charged for secondary grades but, except where in lieu of taxation, they are quite nominal.

In general, school boards submit their budgets to the local municipal councils which levy for and collect the required amounts. School Boards in Quebec and some Boards in other provinces have the power to levy and collect taxes for school purposes. Assessment on which taxes for school purposes are levied is the valuation of land and buildings (or improvements in some cases) and usually some other factor such as personal property, or any form of business income.

Each province has its own method of apportioning grants to local school boards. These grants are of two types: (1) The basic grant may be calculated on a basic minimum cost, an amount per classroom, salary and qualifications of teacher, average attendance, etc. All provinces adopt some means of increasing equality of opportunity by favouring poorer areas over richer ones. (2) Special grants are paid for such features as transportation, music, arts and crafts, special classes, equipment, building costs, night classes, etc. Special grants loom largest in Quebec where there is marked emphasis on training for home industries, arts and crafts.

Table 5 presents a comparable statement of the finances of the Boards operating provincial schools so far as this can be done with existing records.

#### 5.—Financial Support of Provincially Controlled Schools, by Provinces, for Provincial Fiscal Years Ended 1939, 1947 and 1948

NOTE.—The receipts shown in this table do not include any amounts raised by loans or the sale of bonds or debentures, as all revenue of this nature must be repaid ultimately with money raised by local taxation. With the exception of the Maritime Provinces, for which the information is not available, the total net debenture indebtedness of the schools of each province is given annually, thus showing the net increase or decrease per annum. Figures for 1914-25 will be found at pp. 985-987 of the 1936 Year Book and those for 1926-46 in the corresponding tables of subsequent editions. For dates on which the fiscal years of the provinces end, see p. xiv.

<sup>1</sup> Net figures, after deduction of sinking funds, except for British Columbia, 1939, for which the gross figure is given.

<sup>2</sup> Includes contributions to teachers' salaries in the Maritime Provinces and, in New Brunswick, grants made to schools by the Vocational Education Board.

<sup>3</sup> Includes amounts raised by counties and, in Ontario, the township grants on salaries of rural public school teachers.

<sup>4</sup> Latest available figures.

<sup>5</sup> There are, in addition, 3,799 local boards within larger units.

<sup>6</sup> In 1946 the local school districts were amalgamated into larger administrative units.

### Subsection 2.—Private Elementary and Secondary Schools

Private schools include all those not operated by publicly elected or appointed boards. Except in Quebec, they receive no support from public funds. Instruction is similar to that given in public schools except that more opportunities may be given for music, art, etc., and in schools under religious control there is greater emphasis on religious instruction. In most provinces there is some form of inspection or regulation by the provincial department of education.

Of the 783 private schools reported in 1948, 522 were in Quebec, 93 in Ontario, 93 in the Prairie Provinces, 40 in British Columbia and 35 in the Maritimes. There were 6,622 full-time teachers of whom 1,253 were men. Outside of Quebec, the salaries for lay teachers ranged from \$600 to \$4,800 with a median of \$1,325 for women, and from \$800 to \$8,000 with a median of \$2,037 for men.

Sixty-three per cent of the pupils were in the elementary grades. At the elementary level there were 41,000 girls compared with 24,000 boys; at the secondary level there were 22,000 girls compared with 11,000 boys.

The private schools are financed largely from fees, legacies, gifts, or by religious orders. The fees range from very little to upwards of \$1,000 per year. In 1948 they averaged \$100 for day students and \$500 for boarders. Excluding Quebec, the expenditures of the private schools in 1948 amounted to over \$6,500,000. Of this amount \$1,970,000 was paid out in teachers' salaries.

### 7.—Enrolment in Private Elementary and Secondary Schools, by Provinces, Specified School Years Ended 1921-48

NOTE.—Figures for intervening years will be found in the corresponding tables of the 1937, 1942 and 1946 Year Books.

<sup>1</sup> Exclusive of Quebec.

**Business Colleges.**—Of the 164 schools reported in 1948 for eight provinces (exclusive of Quebec) 19 were in the Maritimes, 90 in Ontario, 31 in the Prairie Provinces and 24 in British Columbia. Full-time teachers numbered 163 men and 331 women and part-time teachers 52 men and 112 women.

Girls predominate in the student body and the enrolment in evening classes is almost equal to the full-time day enrolment. The 1948 enrolment was: full-time day classes, 3,445 boys and 10,197 girls; part-time classes, 314 boys and 1,267 girls; evening classes, 3,840 boys and 9,481 girls. The total for the year was about 2,000 less than in 1946 and 1947. Fifty-five per cent of the full-time and part-time students were 17 to 19 years of age.

Monthly fees ranged from \$5 to \$25 for day classes and from \$3 to \$15 for evening classes. Total operating expenditures for these schools amounted to over \$1,500,000, of which \$830,000 was for teachers' salaries.

### 7.—Enrolment in Private Business and Commercial Schools (Business Colleges), by Provinces, Specified School Years Ended 1921-48

NOTE.—Figures include day and evening classes. Those for intervening years will be found in the corresponding tables of the 1937, 1942 and 1946 Year Books.

<sup>1</sup> Exclusive of Quebec.

### Subsection 3.—Indian Schools\*

There has been a great expansion in the education work carried on by the Federal Government for the benefit of Indian children and adults. In the year ended Mar. 31, 1950, a total of 403 Indian schools were in operation, including 69

\* Prepared in the Indian Affairs Branch, Department of Citizenship and Immigration.

residential, 5 combined and 329 day schools. The total enrolment in residential schools was 9,316 and in the day schools 14,093. Since 1947 there has been a total increase in day-school enrolment of 3,111 pupils.

In 1949-50 there were 1,180 children in elementary grades in provincial schools and 465 Indian pupils in secondary provincial schools, a total enrolment of 25,054 Indians in educational classes.

An active building program has continued and many new day schools have been erected. Tuition grants are also paid to individual pupils to assist their attendance at high schools, technical schools and universities. In 1949-50 there were 834 Indians benefiting from secondary education.

**8.—Enrolment and Average Attendance at Indian Schools, Years Ended  
Mar. 31, 1941-50**

Year	Residential Schools		Day Schools		All Schools		
	Enrolment	Average Attendance	Enrolment	Average Attendance	Enrolment	Attendance

1945.....	8,865	8,006	7,573	5,159	16,438	13,165	80.1
1946.....	9,149	8,264	9,656	6,779	18,805	15,043	80.0
1947.....	9,304	8,192	10,318	7,449	19,622	15,641	79.7
1948.....	8,986	7,863	11,115	8,296	20,101	16,159	80.3
1949.....	9,368	8,345	12,615	10,414	21,983	18,759	85.3
1950.....	9,316	8,593	14,093	12,060	23,409	20,653	88.2

Enrolment by provinces for the year 1949-50 was as follows: Prince Edward Island, 46; Nova Scotia, 592; New Brunswick, 397; Quebec, 1,957; Ontario, 5,398; Manitoba, 3,208; Saskatchewan, 3,229; Alberta, 2,775; British Columbia, 4,886; Yukon, 270; and the Northwest Territories, 651.

The administration of Indian affairs generally by the Indian Affairs Branch of the Department of Citizenship and Immigration is dealt with in Chapter XXIX.

**Subsection 4.—Universities and Colleges**

Enrolment in the full-time session of the universities and colleges of Canada increased from pre-war levels of less than 40,000 students to more than 83,000 in the academic year 1947-48. This was due in large part, but not entirely, to the Government's program of assistance to veterans.

The number of veterans receiving aid, as reported by the Department of Veterans Affairs, decreased from 35,000 in 1946-47 to 30,500 in 1947-48. (See also p. 307.) After allowance for the veterans completing courses beyond the period of Government assistance, it appears that the non-veteran enrolment was about 40 p.c. higher than that of the pre-war years.

A significant feature of the post-war enrolment is the increasing number of students pursuing post-graduate studies. In 1938 there were 1,731 graduate students enrolled in the regular session; in 1948 enrolment in post-graduate courses

increased 172 p.c. to 4,707 students. In terms of graduate degrees conferred, the comparisons are as follow: Masterships and Licences, 496 in 1938 and 1,174 in 1948; Doctorates in Course, 84 in 1938 and 134 in 1948. The doctoral degrees awarded are mainly in the natural sciences although the imbalance between the natural sciences and the humanities and social sciences is decreasing. In 1938 students seeking admission to doctorates in the natural sciences represented 82 p.c. of the total registration; the corresponding registration for 1948 represented 70 p.c. of the total.

There were 13,733 bachelor degrees and first professional degrees awarded in 1948 as compared with 6,439 in 1938. Graduates in science and commerce in 1948 were more than three times those of 1938; awards to university-trained teachers doubled and those to professional social workers were four times greater than they were ten years ago.

## GRADUATES IN SPECIFIED PROFESSIONS

1921-48

Teaching staff, until recent years, kept pace with changes in enrolment. The personnel reported at intervals since 1921 were as follows:—

Academic Year	Faculties of Arts and Science		Professional Schools		Totals (excluding duplicates)	
	Full-time	Part-time	Full-time	Part-time	Full-time	Part-time
1921.....	1,191	242	942	1,179	2,133	1,352
1931.....	1,776	519	1,127	1,705	2,903	2,077

<sup>1</sup> Includes Bachelors of Letters and of Social Science.  
Secretarial Science.

<sup>2</sup> Includes Bachelors of Accountancy and Architecture from the Schools of Fine Arts of Montreal and Quebec.

<sup>3</sup> Includes diplomas in Architecture from the Schools of Fine Arts of Montreal and Quebec.

<sup>4</sup> Excludes teachers' diplomas.

<sup>5</sup> Includes M. Com. and M. Ed. or M. Paed.

<sup>6</sup> Includes M.A.Sc., M.S.A., M.Sc.F., M.Arch., M.V.Sc., M.Sc., Dent. M. Surgery (where conferred separately).

<sup>7</sup> Except diplomas for teachers and theologians.

**INCOME SOURCES OF CANADIAN UNIVERSITIES AND COLLEGES**  
**1946-49 COMPARED WITH CERTAIN PRECEDING YEARS**

PER CENT OF  
TOTAL INCOME

(Exclusive of board and lodging)

**Financial Conditions.**—Current expenditures of the universities and colleges have risen from \$15,000,000 in pre-war years to more than \$36,000,000 in 1948—an increase of about \$100 per student enrolled in the full-time session. Previous to 1940, government grants represented about 43 p.c. of the total income, fees from students 32 p.c., returns on investments 13 p.c. and other sources 12 p.c. In recent years the students have been required to meet a higher proportion of the income. In 1948 the proportions were as follows: Government grants 41 p.c., fees 41 p.c., investments 7 p.c. and other sources 11 p.c.

Since 1945, capital expenditures reported have increased about \$10,000,000, endowments have been augmented by \$5,000,000 and trust funds by some \$20,000,000.

#### 10.—Statistics of Income and Capital Resources of Universities and Colleges, Specified School Years Ended 1921-48

NOTE.—The larger universities and many of the colleges in Canada are included and represent an enrolment of approximately 80 p.c. of the full-time students of university grade throughout the period. The institutions omitted are mainly those conducted by religious orders where teachers receive little or no salary and the financial returns consequently do not represent a comparable record.

**University Training Under the Veterans' Rehabilitation Act.\***—Assistance to veterans in training is provided under the Veterans' Rehabilitation Act as outlined in the 1948-49 Year Book at pp. 321-322.

Veterans were expected to commence their university training within fifteen months after discharge. Therefore, the number entering training has dropped very sharply. During the academic year 1949-50 there were approximately 15,000 veterans in universities who were receiving assistance through the Department of Veterans Affairs compared with about 24,000 in the previous year. Since the commencement of the training program 9,000 veterans have had insufficient qualifying service to carry them through to graduation. Of these, 5,051 qualified for continued assistance by securing scholarship standing in their universities. For the year 1948-49, 92 p.c. of the student veterans passed their examinations and won a high proportion of the available scholarships.

The distribution of the 15,000 veterans enrolled in 1949-50, by academic years, was: first year 878; second year 1,375; third year 3,692; fourth or subsequent year 7,285; and post-graduate 1,956. Since the inception of the rehabilitation program in 1941, 54,000 veterans have received benefits by way of university training.

**Subsection 5.—Statistics of Education in Newfoundland Prior to Union**

Since Newfoundland was not a province in the year for which statistics are given for the other provinces in Section 4, this summary of education in Newfoundland prior to union is presented here.

As already stated (p. 290) the system of education is of the English tradition. The principal variation is in the denominational control of the schools. Each of the five leading religious denominations has its own schools. However, duplication of services is less than 15 p.c. since the schools are not exclusive and most small settlements are predominantly of one denomination. In addition there are 33 non-denominational schools. All classes of schools are subject to the same provincial regulations, follow the same curriculum, and receive provincial grants on the same basis. About 67 p.c. of the schools are one-room schools and 19 p.c. have two rooms. Any school may have all Grades I to XI, but only 23 p.c. of the one-room schools have more than eight grades. A few schools teach Grade XII.

A commercial course is given in Grade XI in some schools. Day and evening courses in handicrafts are given in the Handicraft Centre at St. John's, students in the day classes being recruited from all parts of the Province. The Vocational Institute, originally established for the civil re-establishment of veterans, was, in 1950, operating as a trade school for civilians. A nursery school class for blind children is operated at St. John's to prepare children for entrance to the School for the Blind at Halifax. Teacher training is carried on in Memorial University where a school of navigation is also conducted.

Adult and visual education is promoted by the Department of Education. In the adult-education field there are regular night classes for adults whose scholastic requirements vary from Grade I to Grade XI. In 1947, there were 34 teachers with a total enrolment of over 1,250 pupils in formal classes and 600 in informal study groups.

Table 11 gives statistics for Newfoundland comparable to Table 1 for the other provinces.

**11.—Enrolment in Newfoundland Educational Institutions, School Year 1947-48**

<sup>1</sup> Exclusive of two boarding schools and two day schools operated by the Moravian Missions in northern Labrador in which were enrolled 155 pupils.

The university, associate and first-class grades of certificate require three, two and one years of professional training, respectively, in addition to experience for an equal number of years. Teachers' salaries in 1947-48 amounted to \$2,470,900 of which the Government provided \$2,376,000. Average salaries in denominational schools varied from \$1,044 to \$1,272 for men and from \$885 to \$1,036 for women. The highest average salaries, \$2,085 for men and \$1,285 for women were paid for service in the amalgamated schools.

**13.—Teachers' Certificates and Salary Ranges in Newfoundland, School Year 1947-48**

Grade	Certificates		Total	Salary Range	Teachers—Male and Female
	Male	Female			
	No.	No.	No.		No.

<b>Totals.....</b>	<b>790</b>	<b>1,618</b>	<b>2,408</b>	<b>Total.....</b>	<b>2,278<sup>1</sup></b>
				Median salary.....	\$982

<sup>1</sup> In addition there were 97 religious teachers not on salary and 33 part-time teachers.

Newfoundland schools are financed largely from provincial funds. Tuition fees may be charged for Grades I to VIII only, except in the "colleges" (St. John's) where fees may be charged for Grades I to XI. Fees may be charged also to provide for fuel and cleaning or these may be provided in kind. There is no local taxation for school purposes. Provincial grants are mainly for teachers' salaries, school plant maintenance and repairs, and the erection of buildings.

Figures on local contributions are not available but the Government expenditure on education for the year ended Mar. 31, 1949, is shown in Table 14.

<sup>1</sup> Includes \$59,030 for industrial education and \$4,000 to the Moravian Missions of northern Labrador.

## PART II.—CULTURAL ACTIVITIES RELATED TO EDUCATION

### Section 1.—The Relationship of Art to Education†

**Fine Art.**—Fine art appears as an elective subject in the curricula of the Faculties of Arts in a number of universities, where it may be taken as one subject among five for a year or two; in some, e.g., Acadia University, N.S., there are six or more elective courses. In Mount Allison University, N.B., and in the University of Saskatchewan, there is a sufficient number of courses to allow the taking of a Bachelor degree with specialization in fine art. At the University of Toronto, Ont., an Honour B.A. in Art and Archæology is offered as well as graduate work in this field. Departments of fine arts have been opened by McGill University (1948-49), and the University of British Columbia (1949-50).

There are also schools of art not requiring any fixed academic standing for admission, which are concerned more with the technical development of the artist. The most widely known of these are:—

- Nova Scotia College of Art, Halifax, N.S.
- École des Beaux-Arts, Quebec, Que.
- École des Beaux-Arts, Montreal, Que.
- School of Art and Design, Montreal Museum of Fine Arts, Montreal, Que.
- Ontario College of Art, Toronto, Ont.
- Winnipeg School of Art, Winnipeg, Man.
- Provincial Institute of Technology and Art, affiliated with the University of Alberta, Calgary, Alta. (Summer session at Banff, Alta.)
- Vancouver School of Art, Vancouver, B.C.

Courses in these schools vary in length with the requirements of the individual student, but may extend over as many as four years. Summer schools of art are sponsored by some of the foregoing institutions, by universities, and by various independent groups.

\* Prepared in the Department of Veterans Affairs.

† Revised under the direction of H. O. McCurry, Director, National Gallery of Canada, Ottawa.

Public art galleries and museums in the principal cities perform valuable educational services among adults and children. Children's Saturday classes, conducted tours for school pupils and adults, radio talks, lectures and often concerts are features of the programs of the various galleries. In many cases these institutions supply their surrounding areas with travelling exhibitions, while the National Gallery of Canada carries on a nation-wide program of this nature (see pp. 309-310).

The principal art galleries and museums\* are:—

New Brunswick Museum, Saint John, N.B.  
 Museum of the Province of Quebec, Quebec, Que.  
 Montreal Museum of Fine Arts, Montreal, Que.  
 National Gallery of Canada, Ottawa, Ont.  
 National Museum of Canada, Ottawa, Ont.  
 London Public Library and Art Museum, London, Ont.  
 Art Gallery of Toronto, Toronto, Ont.  
 Art Gallery of Hamilton, Hamilton, Ont.  
 Royal Ontario Museum, Toronto, Ont.  
 Willistead Library and Art Gallery, Windsor, Ont.  
 Winnipeg Art Gallery, Winnipeg, Man.  
 Edmonton Museum of Arts, Edmonton, Alta.  
 Vancouver Art Gallery, Vancouver, B.C.

**Art Organizations.**†—A development of special interest in the field of the creative arts was the establishment, in December, 1945, of the Canadian Arts Council. The Council grew out of the united action taken by its constituent associations in the Spring of 1944, when they presented an integrated series of briefs to the Special Committee of the House of Commons on Reconstruction and Re-establishment. These briefs looked forward to a post-war society in which the arts would be "more widely distributed and more closely integrated with the life of our people". The Council has accordingly taken a very active interest in the development of the community centre idea.

The basic situation claimed by the Council is that "in Canada there are millions who have never seen an original work of art, nor attended a symphony concert or a professionally produced play, while in our largest cities thousands of professional creative artists enjoy a field so limited that they are forced into activities unsuited to their talents". Chief among the proposals for remedying the situation is the establishment of "a government body to promote a national cultural program and provide music, drama, art, and film services for all our people". Other proposals have in view the improvement of industrial design, and housing and town planning.

To list the names of the 16 bodies constituting the Council is to give some indication of the range of professional organization in the field of the arts in Canada:—

The Royal Canadian Academy of Arts  
 The Royal Architectural Institute of Canada  
 The Sculptors Society of Canada  
 The Canadian Society of Painters in Water Colour  
 The Canadian Society of Painter-Etchers and Engravers  
 The Canadian Group of Painters  
 The Canadian Society of Graphic Arts  
 The Federation of Canadian Artists  
 The Canadian Authors' Association  
 La Société des Écrivains Canadiens  
 The Music Committee  
 The Canadian Society of Landscape Architects and Townplanners  
 The Dominion Drama Festival  
 The Canadian Handicrafts Guild  
 The Canadian Guild of Potters  
 The Arts and Letters Club

\* A complete list of Canadian art museums, societies and schools is included in the Canadian section of the current issue of the *American Art Annual* (Washington, American Federation of Arts).

† See also p. 307.

**The National Gallery of Canada.**—Founded in 1880 by the Marquis of Lorne, the National Gallery at first served only as an exhibition gallery. Provided with an Advisory Arts Council in 1907, and incorporated under a Board of Trustees in 1913, it has assembled its permanent collection largely during the past 40 years. This collection of pictures and sculpture, prints and drawings, representing the styles of past and present of various parts of the world, was assembled for public enjoyment, study, and the improvement of arts and industrial products, and as the necessary basis for any program of art education. The collection of the National Gallery to-day is of international repute and is accessible to the whole country by means of catalogues, photographs and colour reproductions and to a limited extent by loans. The Canadian section, naturally the most inclusive, is the best available source for the study of Canadian art.

In 1946, the Massey Collection of 75 English paintings was presented by the Rt. Hon. Vincent Massey, C.H., and Mrs. Massey as trustees of the Massey Foundation. In 1948 the donors made a further gift. Now comprising 86 pictures, the Massey Collection makes the National Gallery a leading centre for the study of British art, and is the largest gift in the Gallery's history. Among other recent acquisitions and gifts are paintings by Quentin Massys, Murillo, Zoffany and Renoir, and sculptures by Epstein. Additions to the Canadian section include a group of important works, particularly by contemporary artists; of special note is the gift by the artist of twelve canvases by Lawren Harris. A new catalogue of the paintings in the National Gallery was published in 1948. A number of important additions have been made recently to the print collection: a complete set of first impressions of Piranesi's *Prisons* (presented by H. S. Southam, C.M.G., LL.D.); a rare early woodcut *circa* 1440; engravings by Schongauer, Beham, Mabuse and Jacopo da Barbari; the Hornibrook collection of Morin's portrait engravings; Tiepolo's *Capricci*; and modern prints by Rounault, Picasso and a number of Canadian artists. Drawings by Savery, Lievens, Jan Breughel, Veronese, Girtin and Towne have also been added.

Exhibitions of the art of other countries organized at the National Gallery during 1949 and 1950 included: *Paul Nash*; *British Drawings*; *South African Art*; *German Painting*; *Swedish Museums*; *Contemporary Paintings from Great Britain, France and the United States*; and *Queen Mary's Carpet*. Recent Canadian exhibitions included: *Arthur Lismer*; *Contemporary Canadian Sculpture*; *Four Painters of Quebec*; and *Progress through Design*. The greater number of these were available to the entire country and were widely circulated under the National Gallery's auspices. The more important of the exhibitions sent abroad recently by the National Gallery included: *Canadian Painting* to the Museum of Fine Arts, Boston, U.S.A., July-September, 1949; *The Massey Collection of English Painting* to Australia, New Zealand and Hawaii, 1949-50. A comprehensive Canadian exhibition is scheduled for the National Gallery of Art at Washington, U.S.A., in the autumn of 1950.

The National Gallery carries out a program of extension work throughout Canada. Travelling exhibitions of the art of Canada and other countries are shipped through the country under the Gallery's auspices. About 30 such exhibitions, including those of the several chartered art societies, are circulated annually and other responsible organizations in various regions draw upon the services of the Gallery as the source of a great part of their offerings to the public. In this way actual works of art are constantly being brought to the attention of the Canadian people. Sets of reproductions are sent on tour of localities in various parts of the country which have not the facilities for handling original works of art.

The latest major development in the general educational work of the National Gallery was established, in 1948, as an Industrial Design Section—the result of public interest in bringing the design of Canadian goods up to the best international standards and in fostering distinctive Canadian designs. A number of exhibitions on Canadian industrial art have been held in various parts of the country.

Other methods of education in the arts apply more specifically to young people and are designed, in part, to supplement regular school work. Thus, the Gallery provides written lectures illustrated by lantern slides on all aspects of art history, reproductions of paintings with introductory texts for art appreciation, school broadcasts, classes for school children at the Gallery, exhibitions of children's work, conducted tours of the Gallery's collections and educational demonstrations, public lectures at Ottawa, and lecture tours throughout Canada.

The National Gallery also lends art films, including the colour and sound film *Canadian Landscape*, made in conjunction with the National Film Board and featuring the work of modern Canadian artists since Krieghoff against a historical background of landscape painting in Canada. Silk screen prints by Canadian artists, already famous in many parts of the world as the result of their distribution during the War, are available to schools and the public generally. These and the facsimile colour reproductions published by the National Gallery are listed in the free leaflet, *Reproductions, Publications, and Educational Material*. The magazine *Canadian Art*, in the publication of which the National Gallery takes a leading part, has doubled its circulation since 1945.

**Museums and Art Galleries.**—The 1939 Year Book, at pp. 1025-1026, gives a list of the museums (including art galleries) in Canada employing full-time staff, showing floor space and average daily attendance of each. There has been no official detailed report published by the Dominion Bureau of Statistics on this subject since 1938.

In 1947, the Canadian Museums Association was formed with the object of aiding in the improvement of the services of museums as educational institutions by promoting co-operation among themselves, by exchanges with other countries, and by the training and securing of expert staffs.

## Section 2.—The Educational and Cultural Functions of the National Film Board\*

The production and distribution of 16mm informational films by the National Film Board has had marked influence upon community life in Canada. Thousands of people apprehensive of the more formal types of education have learned how to make use of films for the manifold purposes of the community. The cultural influence of films was noted by many organizations in submissions to the 1949-50 Royal Commission on the National Development in the Arts, Letters and Sciences.

National Film Board productions are related to Canadian needs by the reports of the ten provincial offices of the Board and of the regional branches of other government departments. But the appositeness of film production is hardly sufficient to explain the vast interest shown in 16mm films by Canadian communities. Much of the success of the 16mm film movement in Canada is the result of provincial, regional and local planning on behalf of film distribution.

\* Prepared under direction of W. Arthur Irwin, Government Film Commissioner, National Film Board. The non-educational services of the National Film Board are outlined in Chapter XXX.

Most urban communities and some rural districts have a film council—a body formed by local film-using groups to sponsor a local film library, purchase projectors, organize training classes for local volunteer operators, and develop more effective use of films. The accessibility of educational films throughout Canada is due largely to the growth of the community film council movement. Community film councils are aided by the support and encouragement of provincial institutions, such as departments of education and university extension branches, and by the technical assistance of National Film Board staff.

As a result of such widespread local interest in educational films, thousands of people have been involved in the processes as well as the aims of education. In each participating group there is someone who has learned to operate a projector, to choose a film, and to integrate the film into his group's program. Some estimate of the number of people so involved may be gathered from the information that there are, in Canada, 300 film councils, each representing 10 to 200 groups, and 265 film libraries and depots. Through councils, libraries, locally operated film circuits and National Film Board rural circuits, close to a million people a month see National Film Board films.

**Problems of Film Distribution.**—While many communities have established local film services, a number of problems still hamper the application of films to community cultural purposes. The larger problem is that of obtaining appropriate subjects. As the public becomes more familiar with the role of films in community life, the taste for them becomes less easily satisfied. A group which a year ago found almost any film acceptable now asks for those that relate directly to its program. Although in the past decade the National Film Board has deposited well over 25,000 films in local libraries the demand to-day is greater than ever.

This need is being met by more specific production and by the organizing of regional and provincial film libraries on which local film borrowers may draw. University extension branches have been particularly active in trying to meet the more intensive demand for films. A joint planning commission under the ægis of the Canadian Association for Adult Education has also given considerable thought to the needs of Canadian film borrowers. By and large, however, the solution to the problem of obtaining films suited to the more specialized needs of further education rests first with production and next in larger local budgets for the purchase of films.

Demonstrations related to the use of films have helped considerably to stimulate initiative in using the films on hand. Film councils are now accustomed to organizing film workshops, festivals and institutes where the application of films educationally and culturally can be practised and studied. Provincial educational bodies often co-operate in such projects. The recent film workshops in Alberta, for example, were sponsored by film councils, while the University of Alberta extension staff and the regional office of the National Film Board provided technical instruction and other assistance. Similar support and encouragement of local initiative is evident in other provinces.

Rural film circuits are administered by the extension department of the University of British Columbia, and in the Atlantic Provinces the distribution of National Film Board films to adult audiences is directed by the Departments of Education. In some provinces, federations of agriculture assist with rural film distribution.

**National Film Board Field Services.**—To encourage further responsibility for film services by local, regional and provincial organizations, the National Film Board offers an information service which includes instructional material\* on how to organize film services, specialized film libraries (health, medicine, industry, recreation, etc.), and practical assistance by district field representatives. National Film Board field representatives coach the community film councils in organization of local film services and may, when needed, loan projection equipment and films.

The rural community has followed the urban pattern of locally operated film services but its progress toward independence has been less rapid. Many rural areas still rely on the National Film Board either to provide film showings or to supply film programs.

Film programs for both children and adults in rural areas are released monthly by the National Film Board. The programs usually include a discussion film, a film on agriculture, and other films suited to the rural classroom. The programs are accompanied by supplementary materials: posters to advertise rural showings, teachers' guides which accompany classroom films, and discussion guides to encourage discussion of any film subject of particular interest or import to the audience.

### Section 3.—The Educational and Cultural Functions of the Canadian Broadcasting Corporation†

The Canadian Broadcasting Corporation devotes a considerable portion of its broadcast time on the English- and French-language networks to programs of an educational nature directed to both children and adults. When possible, education and entertainment are combined.

**Pre-School Broadcasts.** — Through the establishment of the CBC's *Kindergarten of the Air*, pre-school-age children in Canada have the opportunity of gaining some of the benefits of kindergarten training. The program, conducted daily Mondays to Fridays, is designed for children of from 2½ to 6 years of age. It is planned with the advice of kindergarten experts and representatives of the Canadian Home and School Federation, the Federation of Women's Institutes and the Junior League. While the program is designed primarily for home listening, it has also been found useful in organized kindergarten groups and classes. It teaches children many stories, songs, mental games, keeping-fit exercises, information about animal life and nature study and encourages good habits of hygiene, eating and relaxation.

**School Broadcasts.**—During 1948-49, through the facilities of the CBC, schools throughout Canada were provided with at least 30 minutes daily of broadcast programs specifically planned by departments of education to meet classroom requirements. The number of classes listening to the broadcasts was approximately 20,146 made up of 429,087 students. There were 6,764 free receiving licences issued to schools during the year ended Mar. 31, 1950, by the Department of Transport.

During the 1949-50 season the CBC presented 25 programs in the National School Broadcasts series, each of 30-minute duration, including programs for Grades III to X and special programs for high-school students. New features introduced included four dramatized broadcasts on world order and world peace, called *Citizens*

\* *Film and You*, an instructional film, and *Films Serve the Community*, a filmstrip, are available from NFB field staff.

† Prepared under the direction of Dr. Augustin Frigon, C.M.G., General Manager, Canadian Broadcasting Corporation. The non-educational services of the CBC are outlined in Part VII, Sect. 3, Chapter XX.

of the World; a second series of exchange programs direct from Commonwealth Countries, *Children of the Commonwealth*, with contributions from New Zealand, Britain and Australia; historical and descriptive broadcasts on Canada's new province, *Newfoundland*, and a full-length performance of Gluck's opera *Orpheus*, specially prepared for high-school students. A complete performance of Shakespeare's play *Macbeth* was also broadcast in four instalments for high schools. Through the courtesy of the British Broadcasting Corporation, the CBC presented, at the request of departments of education, a special selection of BBC school broadcasts. Provincial departments of education, in co-operation with the CBC, also presented daily school-radio programs suited to the course of studies followed in each province.

In Quebec, on the CBC's French network, Radio-Collège broadcast educational programs centring mainly on the 20th century and covering literature, art, science, music, history, sociology and drama.

Particulars of all school broadcasts in Canada are contained in the manual *Young Canada Listens* published each year by the CBC and circulated among teachers and educational authorities.

**Adult Education.**—Programs of an adult educational nature are presented on all CBC networks in a variety of forms and on a wide range of subjects including national and international affairs, politics, business and labour interests, women's interests, community activities and social problems, literature and creative writing, science, nature and sports. *Citizens' Forum*, a discussion program on public affairs, is now in its seventh year. Broadcasts usually originate from public meetings. The series is produced in co-operation with the Canadian Association for Adult Education which has organized about 500 listening groups across the country. This Association, with the Canadian Federation of Agriculture, helps in the preparation of another CBC series, *National Farm Radio Forum*, on which farmers from all parts of Canada are able to exchange views and discuss their problems. Now in its tenth year, *National Farm Radio Forum* is followed by more than 1,500 listening groups throughout rural Canada. Both these discussion programs have their counterparts on the CBC French network, *Les Idées en Marche* and *Le Choc des Idées*.

Two significant programs inaugurated more recently are *Cross Section*, which deals in documentary style with economic and social issues and questions of special concern to business and labour, and *In Search of Ourselves*, a series on human relations prepared in co-operation with the Canadian Mental Health Association. This program is used in discussion by several hundred listening groups organized by Home and School Associations.

In the autumn of 1948 a special series *In Search of Citizens* was arranged in co-operation with interested Federal and Provincial Government Departments to acquaint Canadians with some of the problems of newly arrived immigrants. This was continued with success during the 1949-50 season. Regular commentaries on national and international affairs are heard in *Capital Report*, *Weekend Review* and *International Commentary*.

In order to present commentaries on the European scene, the CBC maintains an overseas bureau with headquarters at London, England. It also has an office and a resident correspondent at the United Nations Headquarters, Lake Success, N.Y.

Special programs for women in both English and French offer practical information on household problems, citizenship, community organization, child psychology, and on national and international questions that have special appeal for women.

**Music and Drama.**—The CBC Opera Company, formed in 1948, presented five operas during 1949-50. The season began with the Canadian premiere of Benjamin Britten's modern English opera, *Peter Grimes*, on CBC Wednesday Night. The performance was such an immediate success that it was repeated the following week. This program received the first award for music in the Canadian Radio Awards, sponsored by the Canadian Association for Adult Education on behalf of some 50 Canadian organizations. Other operas broadcast during the season were *Don Giovanni*, a repeat performance, and new productions of *Madam Butterfly*, *Fidelio* and *Carmen*. Once again the CBC Wednesday Night program brought to its listeners complete performances of Bach's *St. Matthew Passion* and Handel's *Messiah*. A highlight during the season was a series of 13 programs of half-hour chamber concerts, including the six Brandenburg concertos, eleven suites, and other concertos for strings and solo instruments, broadcast on the CBC Trans-Canada and French networks to commemorate the bi-centenary of the death of Johann Sebastian Bach. The programs were also heard in Central and South America through the CBC International Service. Concerts by leading Canadian symphony orchestras were also broadcast regularly during the year.

Outstanding dramas on the CBC Trans-Canada network during the year included a full-length performance of Shakespeare's *Macbeth*; a two-hour play, *Socrates*, by Lister Sinclair, and adaptations of *The Village Wooing* by George Bernard Shaw, John Ruskin's *The King of the Golden River*, Goethe's *Egmont*, *Le Bourgeois Gentilhomme* by Molière and Osbert Lancaster's satirical farce *The Saracen's Head*. A performance of *The Trial*, by Franz Kafka, was judged best by the Canadian Radio Awards drama panel, whose members gave it the first award in the open drama competition. The Sunday night *Stage* series from Toronto was again honoured in the Ohio State University awards, this time winning a first award for "admirable choice of subjects with a willingness to include original material; for the fine and robust texture of the acting; and for the notable quality of its musical background". In the Canadian Radio Awards, a *Stage 49* play, Lister Sinclair's *The Story of Hilda Morgan*, received honourable mention as "an excellent original play", and special attention was drawn to the production by Andrew Allan and the music by Lucio Agostini. During the year, this period included the last instalments of Dickens' *Pickwick Papers* and the beginning of a series adapted from *Nicholas Nickleby*, broadcast on the CBC Dominion Network. Others were *A Name to Remember*, about prominent figures in history, and *The Saga of Bob Edwards*.

French network productions included, under the title *Le Théâtre de Radio-Canada*, such plays as *Week-end* by Noel Coward; *Chifferton*, by André Birabeau; *Trois Mois de Prison*, by Charles Vildrac; and the *Théâtre dans un Fauteuil* presented such items as *Le Dîner est en Retard*, by Colette; *Étincelle*, by Édouard Peilleron; *On ne Saurait Penser à Tout*, by Alfred de Musset; and Beaumarchais' *Le Barbier de Seville*.

## Section 4.—Royal Commission on National Development in the Arts, Letters and Sciences\*

The Royal Commission on National Development in the Arts, Letters and Sciences was established by P.C. 1786 on Apr. 8, 1949. The members of the Commission are: The Rt. Hon. Vincent Massey, P.C., C.H., Chancellor of the University of Toronto (Chairman); Arthur Surveyer, Esq., B.A.Sc., C.E., D.Eng., LL.D., Civil Engineer, Montreal; Norman A. M. MacKenzie, Esq., C.M.G., K.C., LL.D., President, University of British Columbia; The Most Reverend Georges-Henri Lévesque, O.P., D.Sc. Soc., Dean of the Faculty of Social Sciences, Laval University; Miss Hilda Neatby, M.A., Ph.D., Professor of History and Acting Head of the Department, University of Saskatchewan.

The basis of the appointment of this Royal Commission was a report received by the Committee of the Privy Council from the Rt. Hon. Louis S. St. Laurent, Prime Minister of Canada, submitting that:—

- (1) The Canadian people should know as much as possible about their country, its history and traditions; their national life and common achievements.
- (2) In the national interest encouragement should be given to institutions that express national feeling, promote common understanding and add to the variety and richness of Canadian life.
- (3) An examination be conducted into the federal agencies that already exist and contribute to these ends, including the Canadian Broadcasting Corporation, the National Film Board, the National Gallery, the National Museum, the Public Archives, the Library of Parliament, the National War Museum, the system of aid for research including scholarships maintained by the National Research Council and other governmental agencies, with a view to recommending their most effective conduct in the national interest and with full respect for the constitutional jurisdiction of the provinces.

In line with these objectives the Commissioners were instructed to examine and make recommendations upon:—

- (1) The principles that should govern national policy in respect to radio and television broadcasting.
- (2) The scope and activities of the federal agencies referred to in (3) above, including: methods by which research is aided, including grants for scholarships; the eventual character of the National Library; the manner in which all such agencies and activities should be conducted, financed and controlled, and other matters relevant thereto.
- (3) Methods by which the relations of Canada with the United Nations Educational, Scientific and Cultural Organization and with other organizations operating in this field should be conducted.
- (4) Relations of the Government of Canada and any of its agencies with various national voluntary bodies operating in the field with which the inquiry will be concerned.

The Commissioners were appointed under Part I of the Inquiries Act and are authorized to exercise all the powers conferred on them by that statute: they are to be assisted in their work to the fullest extent by the officials of all appropriate departments and agencies. The Commissioners are empowered to engage such counsel, staff and expert assistance as may be required by them for the proper conduct of their inquiry.

From the time of its establishment in April, 1949, until July, 1950, the Royal Commission on Arts, Letters and Sciences had held over 100 public sessions, one or more in each province. A total of 444 briefs has been received by the Commission at public hearings. Additional briefs submitted by individuals and organizations

\* Prepared in collaboration with Dr. Archibald A. Day, Secretary of the Royal Commission on National Development in the Arts, Letters and Sciences.

were not heard in public. The largest single group of briefs was concerned with radio matters although the majority of briefs did not deal with one subject only but dealt with several matters within the Terms of Reference of the inquiry.

The Commission expects to have its Report printed and ready for the general public by the end of January, 1951 (details of this Report, if published by the time of going to press, will be given in an Appendix to this volume).

### Section 5.—Public Libraries

The biennial survey of public libraries in Canada, 1946-48, covered 680 municipal and association libraries, the regional libraries of Prince Edward Island and British Columbia and the county library co-operatives of Ontario.

The number of volumes reported exceeded all previous records and the classification of reading material showed some change in the decade. Adult fiction in 1937 represented 34 p.c. of the classified volumes; in 1947 the proportion was 29 p.c. Non-fiction increased from 48 p.c. in 1937 to 51 p.c. in 1947; and juvenile books from 18 p.c. to 20 p.c.

In the 1937-47 period, current expenditures also increased considerably, the amount spent on salaries and wages in 1947 being more than double that in 1937. This increase was accounted for by improved individual salaries as well as by an increase in number of employees from 1,200, including part-time workers, in 1937 to 1,990 in 1947. The median salaries of professional libraries advanced about 50 p.c. in the period and the average salary for all employees increased by over 25 p.c.

Local taxes in 1947 accounted for 82 p.c. of current receipts and provincial grants-in-aid over 9 p.c. In pre-war years municipal grants represented 92 p.c. of the income and provincial aid just under 4 p.c.

**Regional Libraries.**—More significant of the progress of library work in Canada is the growth of regional library service. In almost all provinces including Newfoundland some form of regional service is in operation. In Manitoba, Saskatchewan, Alberta and Nova Scotia this form of service is comparatively recent. At least three new regional libraries have been established. In Saskatchewan one is in operation at Prince Albert, and in Nova Scotia Annapolis Valley and Cape Breton each have such services. Alberta and Manitoba have passed permissive legislation and are organizing such libraries.

The regional libraries established in Prince Edward Island and British Columbia, and the Ontario County Co-operative libraries record considerable progress since 1937 as shown in the following statement.

## Section 6.—Canada and the United Nations Educational, Scientific and Cultural Organization

The origin of the United Nations Educational, Scientific and Cultural Organization and its activities up to the First Session of the General Conference (held at Paris, France, in November, 1946) are outlined at pp. 313-315 of the 1947 Year Book. The Second Session of the General Conference was held at Mexico City, Mexico, November-December, 1947, and the program adopted was described briefly at pp. 338-339 of the 1948-49 Year Book.

The Third Session of the General Conference was held at Beirut, Lebanon, November-December, 1948. A report of the Canadian delegation (49 pp. mimeographed) is available from the Department of External Affairs.

The Fourth Session was held at Paris, France, September-October, 1949, the Fifth Session at Florence, Italy, May-June, 1950. Reports on these two conferences, also, may be obtained from the Department of External Affairs, Ottawa.

## PART III.—SCIENTIFIC AND INDUSTRIAL RESEARCH\*

## Section 1.—The National Research Council

Organized research on a national basis in Canada dates from 1916 when, at the suggestion of the Government of Great Britain, the Canadian Government established the "Honorary Advisory Council for Scientific and Industrial Research" under a Committee of the Privy Council. Provision was made thereby for the planning and integration of research work and the organization of co-operative investigations, the post-graduate training of research workers, and the prosecution of research through grants-in-aid to university professors. This was the basis of the Council's work from 1916 to 1924.

The Council early recommended the establishment of national laboratories and a Special Committee of Parliament, appointed to study this recommendation, endorsed the proposal after having heard the opinions of many experts. Financial difficulties intervened, but in 1924 public opinion made it possible to have the Research Council Act passed by Parliament. Temporary laboratories were secured

\* Prepared under the direction of C. J. Mackenzie, C.M.G., F.R.S.; President, National Research Council.

and research on the utilization of magnesian limestones for refractories was carried out so successfully that a wartime industry, established during the First World War, was re-established on a large scale, and has become a producer of materials that have found world-wide markets. As a result, in 1929-30, the Government provided funds for new laboratories.

The National Research Building on Sussex Street, Ottawa, was opened in 1932 and in 1939 construction of the aerodynamics building on a 130-acre site adjacent to the Ottawa Air Station was started. Later several other buildings were erected on this site, including separate laboratories for research on engines, gas and oil, hydraulics, structures, and wood-working and metal-working shops. Since then these facilities have been enlarged and extended and new buildings have been provided for engineering and for low-temperature studies. In 1950 construction was proceeding on a high-speed aerodynamics building and on applied chemistry laboratories.

A Prairie Regional Laboratory, constructed on the campus of the University of Saskatchewan, was opened in June, 1948. A Maritime Regional Laboratory is under construction on Dalhousie University campus at Halifax, N.S.

Administration of the Atomic Energy Project at Chalk River, Ont., was taken over by the National Research Council on Feb. 1, 1947, and operations are being continued in accordance with broad general policies fixed from time to time by the Atomic Energy Control Board.

Laboratories now in operation under the National Research Council include: Research and Medical Divisions of the Atomic Energy Project at Chalk River; and Applied Biology, Building Research, Pure and Applied Chemistry, Mechanical Engineering (aeronautics and hydraulics), Physics and Radio and Electrical Engineering buildings at Ottawa. Medical research is carried on by means of grants to accredited workers in the various medical schools and university hospitals. A Division of Information Services has a field staff of technical officers whose job is to assist the smaller industries across Canada in bringing their operating problems to the attention of the Council. With the extensive library facilities available to the Council, it is possible, usually, to provide the required information at very short notice.

In addition to its Technical Information Service, the National Research Council aids industry in two other main ways. First, it encourages scientists from industry to visit the laboratories of the Council and, in turn, sends its men to visit industrial laboratories. A free and constant flow of personnel and information is thus maintained between the Council and most industries that have laboratories. The aim is to have Canadian industry use the Council's laboratories just as the units of a large company use their own laboratories as sources of scientific information and assistance.

Secondly, the Council undertakes, under contract, research work for any firm which has a problem that cannot be solved by private consulting and testing laboratories, and also obtains assistance, in return, from many companies. The Council has long-standing and intimate contacts of this co-operative kind with many Canadian industries in different fields—refractories, oils, metals, chemicals, and transport, to mention only a few examples.

Promotion of research training of scientific workers has been carried on by the National Research Council since its inception along three lines: (1) scholarships awarded annually to carefully selected university students who show an aptitude

for research; (2) assisted research grants to heads of science departments in the universities for the employment of junior assistants and the purchase of special equipment for research purposes; (3) award of post-graduate and post-doctorate fellowships in the natural sciences and in medicine.

Consolidated grants in substantial amounts are also now being made for the conduct of approved projects by competent research scientists in universities and some other institutions.

**Principal Activities, 1949-50.**—A progressive spirit marks the work of the National Research Council. With the entry of Newfoundland into Confederation in 1949, the Council expanded its operations to include the new Province. The Technical Information Service representative visited most of the secondary industries in Newfoundland in the late summer and, in co-operation with the Provincial Government and the Industrial Development Board, completed arrangements whereby the Technical Information Service will serve Newfoundland industries in the same efficient way as it has been aiding other Canadian industries.

While much of the work of the National Research Council is directed towards increasing the efficiency of Canadian industry and finding useful outlets for industrial waste products, there is a noticeable trend towards recognition of the importance of pure science research as a means of keeping investigators abreast of world developments and, indeed, of leading the way to new scientific discoveries.

In this connection, it may be noted that, as part of its recruitment plan, the Council is now offering post-doctorate fellowships on an annual basis. Under this plan, more than 50 highly skilled scientists from 37 universities, including 11 Canadian institutions and 26 located in ten other countries, have been brought into the laboratories to work under the direction of the Council's leading scientists. Their advent has proved a refreshing stimulus to pure research, and their presence in the laboratories means that the fame of the National Research Council is being extended to all parts of the world.

The Council's Atomic Energy Project at Chalk River had a highly successful year. The NRX reactor continued its satisfactory performance enabling the scientists to obtain much new knowledge of a fundamental nature and to produce an abundant supply of isotopes.

An improved type of neutron spectrometer has been constructed and put into operation. A vigorous program of research on the mechanism of radiation-induced gene mutation in bacteria is being prosecuted by the medical and biological branch. These experiments are yielding very interesting results.

A new isotope separation laboratory has been completed and the number of shipments of an increasing variety of radioisotopes to Canadian industries, universities and research institutions more than doubled during the year. Recently, requests for 500 millicurie sources of Cobalt 60 have been received from the Ontario Research Foundation and the British Columbia Research Council. These materials, made in the Chalk River plant, and valued at \$2,500, will be supplied without charge as a grant from the Council to promote research in their use.

A regional station is being developed at Saskatoon, Sask., where building problems of special interest to the Prairie Provinces are being studied. A large laboratory facility put into operation early in 1950 is being developed for testing wall sections under severe conditions. A special test building and access tunnel have

been constructed. The huts will be heated through the tunnel but exposed to all the rigours of the Prairie winter in order to determine the performance of different types of wall construction under actual climatic conditions.

A heat pump has been installed for demonstration purposes and for studying the economics of the use of a heat pump under Eastern Canada conditions. The Division co-operated with civic authorities in making a detailed study of vibration troubles caused by trolley buses operating in Winnipeg, Man. One member of the staff resident at Toronto, Ont., is attached to the staff of the Construction Engineer of the Toronto Transportation Commission as research engineer on the new subway where problems in construction and design may be studied on a full-scale basis.

Service to the Royal Canadian Air Force and to the Canadian aviation industry by the Council's aeronautical laboratories, Division of Mechanical Engineering, is being maintained at a high level. Much of the work done is on a co-operative basis and therefore highly effective.

Industry and the Royal Canadian Air Force have assisted in the development of modern high-speed aircraft. Using a Mustang aircraft, modified and equipped to function as a flying wind tunnel, models are being tested in the transonic speed range. A high-speed aerodynamic laboratory opened in June, 1950, marks a step forward in this field of research. Facilities are provided at Arnprior, Ont., for the flight-testing of aircraft. Vibration tests and the strength testing of full-scale aircraft components—wings, fuselage and empennage, can be made.

The investigation of icing and the protection of aircraft against this hazard has been continued. The protection of gas turbines (jets) from icing is being actively studied.

Tests have been made using dry ice to seed clouds of different types under a variety of conditions in an investigation of induced precipitation. A 30-mile stretch of the Fraser River and its delta is under investigation for possible improvement of the navigation channels and a scale model is under construction at the University of British Columbia.

Problems associated with the movement of logs in rivers, including the diversion of logs past power plants and the formation of log jams, are being studied.

Cold-weather research on fuels and lubricants is being carried out since the successful operation of mechanical equipment, such as motor-vehicles, aircraft, diesel-powered equipment and even diesel locomotives, at low temperatures, is directly dependent upon the use of suitable fuels and lubricants.

Radio problems in connection with aircraft are being studied in the Radio and Electrical Engineering Division. The very high speeds realized by jet-propelled aircraft have made it necessary to enclose all the antennæ within the flow lines of the aircraft, because the aerodynamic drag of an exterior antenna would be entirely too great.

Aids to navigation, both for marine use and in the air, are also being provided. Marine craft not equipped with radar frequently become uncertain of their position when navigational lights are obscured by heavy weather. An experimental system designed to meet this problem has been developed and tested with promising results.

A program of photographic, visual and radar observation of meteors is being carried on in collaboration with the Dominion Observatory, Ottawa, with the object of adding to the existing knowledge of meteors and of the upper atmosphere.

Radar systems are being tested as part of a program to accelerate the accurate survey of Canada. Shoran, a wartime radar development for blind bombing, provides the navigator of an aircraft with continuous and accurate measurement of his distance to each of two fixed ground-radar beacons.

Recovery of oil from Alberta bituminous sands by flash distillation in a fluidized bed of dry sand is being successfully done on a pilot-plant scale. Work has also started on the use of the same fluidized bed technique for the recovery of oil from New Brunswick and Nova Scotia shale and of sulphur from pyrites.

Recent tests on military and civilian aircraft have provided further evidence of the effectiveness of the rain repellent developed at the National Research Council in maintaining clear vision through aircraft windscreens when flying through rain.

The new silver catalyst developed in the Council's chemistry laboratories for the conversion of ethylene to glycol has been successfully operated for several months on a pilot-plant scale.

The use of modified lignin as a reinforcing and improving agent in some types of synthetic rubbers has been investigated on behalf of a Canadian paper mill.

Work in the Division of Applied Biology includes both fundamental and applied investigations on food preservation, utilization of agricultural crops and residues, fats and oils, seaweeds, biological macromolecules, plant science, animal science, and statistics.

Highlights of the work during the year are as follows: pre-slaughter treatment of hogs has important effects on the keeping quality of pork products; work on a model of a railway refrigerator car showed that changes in car design lower the carrying temperature by several degrees; a method has been developed for preparing pure, undenatured wheat gluten by spray drying; automatic pH control applied to bacterial fermentations indicates that pH control will prove to be just as important as controlling the temperature; and finally, an ultracentrifuge has been put into operation which, together with electrophoretic equipment, provides physical measurements on the fundamental properties of large molecules such as proteins.

At Saskatoon, Sask., the Prairie Regional Laboratory is now well established. Two new units have been equipped and staffed, one of these to work on carbohydrates, the other on proteins. Work was continued on oil seeds and agricultural residues, but was largely on pilot-plant projects. Erection of a starch-gluten separation plant has been started. Equipment for carrying on industrial fermentations has been installed as well as stills for solvent recovery of fermentation products. Oil seeds processing equipment and strawboard cookers, presses, and driers are now in operation.

Physics research includes work in ten main fields: acoustics, cosmic rays, electricity, heat, thermal conductivity and vapour migration, industrial radiology, metrology, optics, spectroscopy, X-ray diffraction and electron microscopy. A new group is now being added for work in theoretical physics.

While much of the work of the Physics Division is in the field of applied physics, undertaken with a view to increasing the efficiency of Canadian industry, it is being more and more recognized that studies in pure experimental and theoretical physics are important as a means of keeping investigators abreast of newer developments. The policy of appointing NRL fellows, selected from the universities of the world, has greatly increased the scope of the Division's fundamental work.

A new spectroscopic laboratory has been established in which interesting studies are proceeding on the structure of atoms and molecules on the basis of their spectra. A 21-foot grating spectrograph has been built and is in operation.

Investigation of the infra-red spectrum of isocyanic acid ( $\text{HNCO}$ ), has shown that the three atoms  $\text{NCO}$  are very nearly in a straight line while the  $\text{H}$  atom is off that line. Other molecules are at present under investigation.

Recently, cosmic ray photographs have been obtained using a special emulsion that is sensitive to light particles produced by cosmic rays. These emulsions have been carried in aircraft of the British Overseas Airways Corporation, and in this way given prolonged exposures to cosmic radiation at high altitudes. Many cosmic stars have been recorded.

Continuous cosmic ray measurements have been taken at Ottawa throughout the year and a station was established in the Arctic at latitude  $74^{\circ} 41' \text{ N}$ , longitude  $94^{\circ} 55' \text{ W}$ , which has been operating since Sept. 1, 1949. Analysis of the results is giving information on the influence of meteorological effects on the various components of cosmic rays.

As an aid to marine navigation, work is being carried out in the acoustics laboratory with a view to improving the efficiency of fog horns; the efficiency of a type B horn has been increased from 0.2 to 10 p.e.

Problems in the heat laboratory vary from tests on the thermal conductivity of furs to friction of synthetic and natural rubber tires on ice. The Katz-Katzmann portable carbon monoxide detector is still being tested as an instrument for measuring air changes, as for instance in theatres. Thermal and electrical conductivity of metals, vapour migration through wood and studies on moisture in wheat, form a group of very practical investigations on which useful results of industrial value are being secured.

Work on industrial radiology has been expanded considerably. Studies have been made of radium standards, including international comparisons, and new radiation standardization equipment is being installed. Work is proceeding on X-ray standards and on the protective qualities of armour plate glass against X-rays. Data for the industrial use of Cobalt 60 have been compiled and published.

Fundamental research is proceeding in X-ray crystallography, particularly on the structures of minerals. A file of standard X-ray powder patterns is being set up to improve the services of the laboratory in identification problems. The electron microscope is being used in a study of a special bacterium of interest to the food biology section.

A dozen or more researches are in progress in optics. Much of the work relates to photographic problems, particularly those concerning aerial photography—cameras, emulsions used on films, investigation of distortions on films and in printing and also in photographic systems. In the colour laboratory numerous studies are being made in telephotometry by examination of the spectra of distant lights. Development of high-speed motion-picture cameras has been proceeding for some time and prototypes have been constructed.

A new temperature and radiation laboratory has been set up with apparatus for the testing of thermocouples and pyrometers in accordance with the International Temperature Scale. In metrology a large part of the work consists in

maintaining Canada's primary standards of length and mass. Highly precise calibration and standardization measurements are also made for government departments and industry.

Nearly 3,000 persons, including about 1,200 at Chalk River, are employed by the Council.

## Section 2.—Other Scientific and Industrial Research Facilities

Aside from the work of the National Research Council, which is the central national organization for research, research is carried on by the Departments of Agriculture, Mines and Technical Surveys, Fisheries, the Board of Grain Commissioners and the Dominion Observatories. These bodies have trained permanent scientific staffs for investigation and research in their own fields such as soil problems, crops, breeding and testing of animals, processing and marketing, extractive and physical metallurgy, silvicultural and forest products, hydrography, ocean and mollusk fisheries, etc. The research and experimentation carried on by the Science Service is outlined in the Agriculture Chapter. The work of the Experimental Farms System is described at pp. 349-352 of the 1948-49 edition of the Year Book. Specialized work in scientific forest research is described in the Forestry Chapter.

The Board of Grain Commissioners employs a staff of seven chemists and 21 assistants in the main research laboratories for milling, baking, malting, etc., while the Dominion Observatories carry out research in the fields of solar physics, astrophysics, seismology, terrestrial magnetism, gravity and other studies.

Universities often show bold initiative in exploring the field of scientific research but with the limited facilities at their disposal the task of carrying their discoveries to a conclusion is not always easy. Government and industrial laboratories are often able to pick up and carry on where the universities leave off.

A number of research foundations have their own special fields of research. The Ontario Research Foundation at Toronto, Ont., established in 1928, is an independent non-profit-seeking scientific organization available to the public and to industry for assistance in matters of a technological character.

The Banting Research Foundation supports the work of the Banting and Best Chair of Medical Research in the University of Toronto and aids medical research throughout Canada.

The Rockefeller Foundation assists various agencies in Canada in the furtherance of scientific research in medical science, natural science, social science and public health.

A detailed account of scientific and industrial research in Canada is given at pp. 979-1012 of the 1940 Year Book. This has been revised to cover developments to 1947 and is available in reprint form from the Dominion Statistician.

# CHAPTER X.—NATIONAL ACCOUNTS AND RELATED ECONOMIC STATISTICS

## CONSPECTUS

	PAGE		PAGE
Part I.—National Accounts.....	325	SECTION 3. CORPORATION PROFITS AND INCOME TO SHAREHOLDERS.....	343
Part II.—Related Economic Statistics.		SECTION 4. ESTIMATES OF NATIONAL WEALTH.....	346
SECTION 1. SURVEY OF PRODUCTION...	332		
SECTION 2. CANADA'S INTERNATIONAL INVESTMENT POSITION.....	328		

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

## PART I.—NATIONAL ACCOUNTS\*

The national accounts, in summarizing the nation's economic transactions, make possible the study of interrelationships in the economic system as a whole. They are particularly important to governments concerned with problems of full employment, taxation and prices, and to business men concerned with programs of investment and marketing.

The national accounts provide a summary of production and consumption in terms of prices established in the market. Hence, it is necessary to keep in mind that the value of the nation's production may change because of price changes and because of changes in the volume of output. When the resources of the economy are fully employed the volume of goods and services produced can increase but slowly from one year to the next since the increase is then dependent on the annual increment to resources of labour and capital or their more efficient utilization. Consequently, a rapid rise in the value of output under conditions of full employment is explained mainly by price increases. When there are unemployed resources in the country, a substantial increase in the value of production of goods and services may occur from one year to the next as these resources are brought into use, even though prices remain stable.

For the first time data are now available showing volume changes as well as price changes in gross national expenditure. Gross national expenditure is shown in current and constant dollars in Table 3. Since the gross national expenditure equals the gross national product these data also reflect volume changes in the production of goods and services as measured by the gross national product. For all other tables the data are expressed in current dollars therefore, year to year changes in these tables must be considered in relation to price changes over the period.

The historical record of volume and price movements as they relate to the national accounts from 1926 to 1949, on the 1935-39 base, will be published during 1951. A description of methods and price indexes used for deflators will also be given.

\* Prepared by the Research and Development Division, Dominion Bureau of Statistics.

The tables presented here cover the more important aspects of the national income analysis; Tables 1 and 2 give main aggregates of national income, gross national product, gross national expenditure and their components. Table 3 gives gross national expenditure in current and constant dollars; other tables are included showing the source and disposition of personal income, government revenue and expenditure, and source and disposition of private saving. None of these tables includes data for the Province of Newfoundland which are not available at the present time. Further information on national accounts can be obtained by reference to National Accounts bulletins, published by the Dominion Bureau of Statistics.\*

**National Income.**—Net national income, or more briefly, national income, is the income currently earned by persons in productive pursuits, whether their services are rendered to business, to governments, or directly to the consuming public. It includes the earnings of residents of Canada from the current year's production of goods and services, that is, the sum of salaries and wages, supplementary labour income (employer contributions to unemployment insurance, pension funds, and Workmen's Compensation funds, and income in kind, etc.), profits, interest, net rent, and net income of agriculture and other unincorporated business.

**Gross National Product.**—Since gross national product is the value of all final goods and services produced in a given year measured by adding together the costs involved in production, it is necessary to add to the sum of the items which form net national income the additional costs of indirect taxes less subsidies, and depreciation of capital assets employed in production, in order to arrive at gross national product.

**Gross National Expenditure.**—Gross national expenditure measures the same aggregate as gross national product, namely, the total production of final goods and services at market prices. However, gross national product is measured in terms of costs, whereas gross national expenditure is obtained by adding together all sales and adjusting them for imports and changes in inventories. Four broad types of sales can be distinguished; sales to persons, to governments, to business for capital account (gross investment at home including changes in inventories), and to foreigners, (exports). The total of these sales includes imports of goods and services. Since the purpose is to measure only production of labour and capital of residents of Canada, imports of goods and services are deducted.

**Personal Income.**—Personal income is the sum of current receipts of income whether or not these receipts are earnings from production. Thus, it includes salaries and wages, net income of unincorporated enterprise, interest and dividends, net rentals of persons, and transfer payments from governments, such as family allowances, unemployment insurance benefits and war service gratuities.

---

\* Reference may be made to "National Accounts, Income and Expenditure, 1942-49 (revised October, 1950)", "National Accounts, Income and Expenditure—Preliminary 1949", "National Accounts, Income and Expenditure, 1941-48 (revised September, 1949)" and to National Accounts publications for 1938-45, 1926-47, and 1939-47, for concepts, methods and sources, as well as more complete detail.

**Recent Developments.**—National income increased from \$12,474,000,000 in 1948 to \$12,917,000,000 in 1949, a gain of 4 p.c. This increase is fully accounted for by the 8 p.c. increase in salaries, wages and supplementary labour income. Net agricultural income declined by 4 p.c. despite higher wheat adjustment payments. This decrease was due largely to a lower physical volume of production. Investment income declined by \$96,000,000 from \$2,379,000,000 in 1948 to \$2,283,000,000 in 1949. This was attributable to a decrease of \$110,000,000 in corporation profits, the largest single component of investment income. The estimate of gross national product and expenditure for 1949 is \$16,074,000,000, an increase of 4 p.c. over 1948 in value terms or 2 p.c. by volume. (See Tables 1, 2 and 3.)

### 1.—National Income and Gross National Product, 1939, 1943-49

(Millions of dollars)

NOTE.—Figures for the years 1926-41 will be found at p. 1089 of the 1948-49 Year Book, and for 1942 at p. 379 of the 1950 Year Book.

Exclusive of Newfoundland.

Gross national expenditure indicates the manner in which the total production of goods and services is utilized. In 1949 there was a further decline in the rate of inventory accumulation. Consumer expenditure on goods and services increased

by 8 p.c., from \$10,151,000,000 to \$10,956,000,000. After allowing for price increases this represents an increase of 3 p.c. in real consumption. Government expenditure on goods and services accounted for 13 p.c. of gross national expenditure in 1949 compared with 12 p.c. in 1948. This increase is mainly due to increased defence expenditures and larger outlays by the provincial and municipal governments on public health, hospital care, maintenance of highways, education and certain capital expenditures. Exports of goods and services remained at approximately the 1948 level of \$4,054,000,000, but imports increased from \$3,636,000,000 to \$3,825,000,000 with the result that net foreign investment declined substantially.

## 2.—Gross National Expenditure, 1939, 1943-49

(Millions of dollars)

NOTE.—Figures for the years 1926-41 will be found at p. 1091 of the 1948-49 Year Book, and for 1942 at page 381 of the 1950 Year Book.

<sup>1</sup> Exclusive of Newfoundland.

The data on value, volume and price changes in gross national expenditure enable a comparison to be made between the total real volume of expenditure (or the total real output) in 1939 and in 1947, 1948 and 1949. As shown in Table 3 the gross national expenditure, in terms of current dollars, was \$16,074,000,000 in 1949 and \$5,598,000,000 in 1939, whereas gross national expenditure deflated by price indexes on a 1935-39 base was \$9,432,000,000 in 1949 compared with \$5,523,000,000 in 1939. Thus, in terms of real volume, 1949 expenditures were 71 p.c. higher than those of 1939 whereas an increase of 187 p.c. is indicated if current dollar values are used. The difference is attributable to a rise in prices between the two periods. The method used to determine price and quantity changes is given in more detail in Appendix "B" of "National Accounts Income and Expenditure 1942-49, Dominion Bureau of Statistics.

### 3.—Gross National Expenditure in Current and Constant (1935-39) Dollars, 1939, 1947, 1948 and 1949

(Millions of dollars)

Item	1939		1947 <sup>2</sup>		1948 <sup>2</sup>		1949 <sup>2,1</sup>

<b>Gross National Expenditure...</b>	<b>5,598</b>	<b>5,523</b>	<b>13,657</b>	<b>9,112</b>	<b>15,503</b>	<b>9,245</b>	<b>16,074</b>	<b>9,432</b>

<sup>1</sup> Exclusive of Newfoundland. <sup>2</sup> Before deduction of inventory revaluation adjustment of \$35,000,000 in 1939, \$576,000,000 in 1947, \$609,000,000 in 1948, and \$131,000,000 in 1949. <sup>3</sup> Physical change in constant dollars.

Personal income rose from \$11,842,000,000 in 1948 to \$12,465,000,000 in 1949. This increase of \$623,000,000 was accounted for largely by the rise of \$543,000,000 in salaries, wages and supplementary labour income from \$7,139,000,000 in 1948 to \$7,682,000,000 in 1949. The increase of \$805,000,000 in personal expenditure on consumer goods and services between 1948 and 1949 was \$182,000,000 greater than the increase in personal income. Only part of this amount is reflected in the decline in personal saving since personal direct taxes decreased by \$37,000,000.

### 4.—Source of Personal Income, 1939, 1943-49

(Millions of dollars)

<sup>1</sup> Exclusive of Newfoundland.

The tables of government revenue and expenditure are designed to include only those transactions which have relevance for the national accounts, and consequently the surpluses or deficits shown here do not agree with those shown in the various public accounts. It has been necessary to adjust the conventional accounting statements of fiscal-year revenue and expenditure to exclude purely bookkeeping transactions as well as the purchase and sale of existing capital assets. Extra-budgetary funds such as unemployment insurance, workmen's compensation and pension funds have been added, and surpluses or deficits of government enterprises likewise are included. In the Federal accounts some of the more substantial adjustments are as follows: national defence recoverable expenditure is added, war refunds are allocated to prior years, corporate taxes are adjusted to an accrual basis, sales of war assets to business are eliminated, and the British Commonwealth Air Training Plan write-off is eliminated from expenditure. In addition, the Federal figures have been adjusted to a calendar year basis by using the monthly figures published by the Comptroller of the Treasury. Government loans to foreign countries and accumulation of gold or foreign exchange are not included with government expenditure.

## 6.—Government Revenue, 1939, 1943-49

(Millions of dollars)

NOTE.—Figures for the year 1942 will be found at page 382 of the 1950 Year Book.

<sup>1</sup> Exclusive of Newfoundland.

For purpose of analysis, expenditure by government may be divided into two main categories: expenditure for the purchase of goods and services; transfer payments, such as: family allowances, old age pensions, veterans benefits, and the greater part of interest on the public debt. The first category represents the demands which governments place on the annual output of the nation. Transfer payments, on the other hand, may be considered essentially as transfer of income from one part of the community to another and simply add to the sums available for spending or saving by the recipient.

During 1949, government expenditure on goods and services increased to \$2,088,000,000 compared with \$1,797,000,000 in 1948 and \$1,562,000,000 in 1947. As mentioned on p. 328 the increase in 1949 was largely accounted for by increased defence expenditures and larger outlays by the provincial and municipal governments on public health, hospital care, maintenance of highways, education and certain capital expenditures. Transfer payments increased by \$55,000,000 from \$1,325,000,000 in 1948 to \$1,380,000,000 in 1949; subsidies increased from \$76,000,000 to \$79,000,000. Using definitions appropriate to the national income accounts the surplus of revenue over expenditure was \$464,000,000 in 1949 compared with \$766,000,000 in 1948. The decline in 1949 was due to increased expenditure without a corresponding increase in revenue. The 1949 surplus was attributable wholly to the Federal Government since the provincial and municipal governments combined showed a deficit of \$51,000,000.

During 1949, gross home investment was \$342,000,000 less than in 1948. Investment in housing increased by \$106,000,000 and investment in plant and equipment by \$60,000,000. However, this was more than off-set by a \$508,000,000 decline in the rate of inventory accumulation.

Net foreign investment, the excess of exports over imports, fell from \$418,000,000 in 1948 to \$162,000,000 in 1949 due to a slight falling off in exports and a considerable increase in imports. In both 1948 and 1949 government surpluses helped to bridge the gap between private saving and high levels of investment.

## 8.—Source of Private Saving, 1939, 1943-49

(Millions of dollars)

NOTE.—Figures for the years 1938-41 will be found at p. 1094 of the 1948-49 Year Book, and for the year 1942 at page 383 of the 1950 Year Book.

## PART II.—RELATED ECONOMIC STATISTICS

## Section 1.—Survey of Production\*

This Section deals with gross and net values of commodity production. Net production, in general, represents an estimate of the amount contributed to the national economy by the leading industrial groups engaged in commodity production. It is made up of the total value less the cost of materials, fuel, purchased electricity and process supplies consumed in production.† For purposes of economic discussion, the net figure should be used in preference to the gross, in view of the large amount of duplication included in the latter.

**Current Trends.**—The value of commodity production in Canada in 1948 was the greatest ever attained in the history of the country. The gross value at \$18,143,186,852 was 24.0 p.c. higher than in 1938 and 20.5 p.c. greater than in 1947, when it stood at \$15,059,932,299. The increase in the value of production was practically continuous from 1938 to the year under review, the recession in 1945 having been the only interruption.

\* Prepared in the Business Statistics Section, Research and Development Division, Dominion Bureau of Statistics.

† A description of the method used in computing gross and net production figures is given in the *Survey of Production*, issued by the Dominion Bureau of Statistics.

Since for most purposes the net value of production is more significant than the gross, the subsequent analysis is based mainly on that phase of the subject. Net production was valued at a record \$9,297,539,436 in 1948 against \$7,687,091,637 in 1947. This important gain was due largely to the rapid advance in prices during the period, although physical output also increased, as evidenced by a rise of about 3 p.c. in the index of the physical volume of industrial production.

The post-war release of pent-up demand for consumer goods in Canada and abroad and record investment in housing, plant and equipment, together with marked improvement in the labour situation and the availability of raw materials, made 1948 a banner year in the history of the Canadian economy as measured by the value of commodities produced. It is estimated that a further expansion in production was achieved in 1949. The index of industrial production rose from 181.5 in 1948 to 184.3 in 1949, and the general index of wholesale prices advanced nearly 2.3 p.c. in the same comparison. The gross income of farm production, however, declined from \$2,709,617,000 in 1948 to \$2,672,601,000 in 1949, indicating an appreciable recession in the value of agricultural output.

**Leading Branches of Production.**—With the exception of trapping, each of the nine industrial groups shown in Table 1 reached an all-time high point in 1948. High building activity and record prices for construction materials resulted in a 38 p.c. increase in the net value of construction over 1947, the most outstanding increase of all the groups. Higher prices and greater physical output also caused forestry and mining to attain their highest positions in history in terms of net value. The former rose more than 12 p.c. over 1947 and the latter nearly 32 p.c. Increases of varying amount were recorded for agriculture, fisheries, electric power and custom and repair. Trapping increased over 1947 after recording a low level from 1941 to that year. Total manufactures surpassed even the wartime peak in 1944, advancing 15 p.c. over 1947 to a record \$4,940,369,190.

Table 1 classifies industry into primary and secondary production, but, naturally, many stages of manufacturing are closely connected with primary activities. Fish-curing and -packing plants, for instance, are operated in close relationship to the fishing fleets, sawmills with forest operations and smelters and refineries with metal mining. The gross and net values of production of such processing industries are given separately in Table 2, which indicates the degree of duplication between primary industries and manufactures eliminated in Table 1.

### 1.—Gross and Net Values of Production, by Industries, 1943-48

NOTE.—Net production represents total value under a particular heading, less the cost of materials, fuel, purchased electricity and supplies consumed in the production process.

Lime.....	8,850,023	5,763,244	11,074,871	7,284,638	1,521,394	26.4	0.9
Salt.....	5,366,032	3,493,193	5,828,467	3,765,785	272,592	7.8	0.5
<b>Totals.....</b>	<b>1,719,695,805</b>	<b>737,453,025</b>	<b>1,992,441,375</b>	<b>838,363,278</b>	<b>100,910,253</b>	<b>13.7</b>	<b>100.0</b>

**Provincial Distribution of Production.**—Each of the provinces established all-time high positions in net value of production during 1948. Despite an advance of 12 p.c. in New Brunswick, the Province receded in relative importance, while Nova Scotia and Prince Edward Island recorded increases proportionally greater than in Canada as a whole. The increase in net production in Quebec over 1947 was nearly 18 p.c.; gain in the Canadian total was approximately 21 p.c. The relative importance of this Province was less during 1948 than in the preceding year. Ontario, with a gain of 19 p.c. in 1948, lost ground in this comparison.

Each of the three Prairie Provinces also gained in this connection, recording gains of more than 30 p.c. over 1947 to establish new maxima and achieve a more favourable position in commodity production. The net output of British Columbia was 16 p.c. greater than in 1947, but the advance was less than in the country-wide total.

### 3.—Gross and Net Values of Production, by Provinces, 1947 and 1948

<sup>1</sup> Based on estimated population figures as given at p. 121.

**Per Capita Production.**—The total of net production per capita in 1948 recorded a new maximum of \$722 which surpassed the previous record of \$611 in 1947 by nearly 18 p.c.

Due to its pre-eminent position in industrial development, Ontario at \$871 was the leader on a per capita basis. The same outstanding position was characteristic of 1938 and 1944. The per capita return of British Columbia at \$817 was in second place in 1948. The same order existed in the pre-war year but Saskatchewan displaced the Pacific Province in 1944. With a per capita production of \$791, Alberta held third place in 1948, the same as in 1938; it had dropped to fifth place in 1944. Quebec maintained the fourth position in 1938 and 1944 but dropped to fifth in 1948. The per capita production of Saskatchewan varied greatly from time to time, depending on the farm output; the standing was fourth in 1948, second in 1944 and eighth in 1938. The production per person in Manitoba at \$639 was fifth in 1948. The Province retained the same order as in 1938 but was more favourable than during 1944.

New Brunswick, Nova Scotia and Prince Edward Island occupied sixth, seventh and eighth places, respectively, in 1948. Nova Scotia receded from sixth place in 1938 to seventh in 1944. New Brunswick advanced from eighth place in 1944 to sixth in 1946.

The highest percentage increase in per capita production in 1948 over 1947 was recorded by Saskatchewan and Prince Edward Island with a gain of more than 32 p.c. Alberta was next with an increase of almost 32 p.c. followed by Manitoba and Nova Scotia with advances of 30 p.c. and 18 p.c., respectively. The provinces, individually, established new maxima in per capita production during 1948.

<sup>1</sup> Duplication between agriculture and forestry, as well as duplication under manufactures (see pp. 333-334). <sup>2</sup> None reported.

#### Leading Branches of Production in Canada and Each Province, 1948.\*

*Canada.*—Surveying the relative importance of the nine groups in Canada as a whole and the change in the industrial structure from the pre-war period, the marked expansion in manufacturing operations is the outstanding feature. The increase during the period was 246 p.c., the contribution in 1948 at 53 p.c. being greater than any other two groups. The relative position of agriculture was maintained at about 21 p.c., the advances in Manitoba and Saskatchewan contributing to the recent standing. Construction and forestry with increases of 370 p.c. and 338 p.c. showed increases greater than the industrial output as a whole.

*Maritime Provinces.*—It is readily apparent that farming is the predominant source of income in Prince Edward Island, accounting for 56 p.c. of the net value of production for that Province in 1948. The role of the industry, however, was not so relatively important as in the pre-war year of 1938, when agriculture produced 61 p.c. of the net output of the Province. During the eleven-year period, fisheries, construction and manufactures showed percentage increases greater than the entire net output of the Island Province. Manufactures was the group of greatest relative importance in Nova Scotia, the output having been more than doubled in the period under review. Fisheries, construction and forestry also bettered their position in relation to the net value of production in the Province. The output of New Brunswick showed a gain of 218 p.c. over 1938, mainly due to marked increases in forestry, fisheries and manufactures.

*Quebec.*—The production of manufactures amounted in 1948 to 63 p.c. of the net output of Quebec compared with 59 p.c. during 1938. The increase during the period was 258 p.c., compared with a gain of 234 p.c. in the net output of the Province as a whole. Forestry and construction were also prominent in the marked advance of the period, contributing 16 p.c. and 8 p.c., respectively. Each of the nine main industrial groups achieved important advances over the pre-war year but percentage increases, greater than the provincial aggregate were registered by three branches only. Agriculture produced 12 p.c. compared with 13 p.c. in the earlier year.

\* This analysis takes no account of the deductions for the elimination of duplication between different groups.

*Ontario.*—The outstanding position of the Province in the field of manufactures is apparent. The share of the industrial group was 66 p.c. in 1948 compared with 60 p.c. of the provincial output in 1938. The net production of the Province rose 198 p.c., while the net value of manufactures was 228 p.c. greater. Construction and forestry also contributed greatly to the excellent showing in the eleven-year period, the increases having been 372 p.c. and 319 p.c., respectively.

*Prairie Provinces.*—The marked improvement in the net output of farming, particularly in Manitoba and Saskatchewan, was a feature of the expansion of the Prairie Provinces. The relative position of agriculture in Manitoba rose from 40 p.c. in 1938 to 47 p.c. in 1948. Advances were also shown in forestry and construction in relation to the net output of the Province. The production of the nine groups was 240 p.c. greater at the end of the period. Agriculture showed a gain of 292 p.c., and the increases in forestry and construction were 308 p.c. and 556 p.c., respectively.

The increase in the agricultural output of Saskatchewan, in 1948, was a notable contribution to the greater total of the Province. The percentage of the net output was 76 p.c. against 67 p.c. in 1938. The gain during the period was 484 p.c. compared with an increase of 412 p.c. in the entire net output. Mining also showed a marked increase, but agriculture dominated the economic activities of the Province.

The net output of Alberta rose 233 p.c. during 1938-48. Manufactures, construction and forestry showed percentage increases of greater proportions. The share of manufactures in the net output rose from 15 p.c. to 16 p.c. The expansion from 1938 to 1948 in construction was outstanding at 761 p.c., the share rising from 3 p.c. to 9 p.c. While the increase in the output of agriculture was not so relatively large as the aggregate for all industries of the Province the proportion at 58 p.c. in 1948 was greater than all other industries combined.

*British Columbia.*—Advances in manufactures, forestry and construction contributed largely to the expansion of the economy of British Columbia. The increase in manufactures was 362 p.c. compared with 270 p.c. in the provincial aggregate. The share consequently rose from 38 p.c. to 47 p.c. Gains of 674 p.c. and 348 p.c. were shown in construction and forestry, resulting in expansion in 1948 to 11 p.c. and 31 p.c. of the net output.

## Section 2.—Canada's International Investment Position\*

A large balance of Canadian indebtedness to other countries has always been characteristic of Canada's international investment position. Much of the development of Canada has been financed by investments of capital from other countries, particularly in earlier decades. This balance of indebtedness has been reduced from the levels immediately before the recent war which, in turn, were lower than the earlier peak period around 1930. Net indebtedness to other countries in 1949 was about \$3,800,000,000 compared with more than \$6,000,000,000 in 1930.

**British and Foreign Investments in Canada.**—The relative importance of British and United States capital invested in Canada has greatly changed in recent decades. British capital constituted the largest part of the external capital invested in Canada before the First World War. United States investments underwent

\* Prepared in the Balance of Payments Section, International Trade Division, Dominion Bureau of Statistics. A more extended review of Canada's international investment position appears in the "Canadian Balance of International Payments, 1926-1948" and details on direct investments in "United States Direct Investments in Canada", both reports published by the Dominion Bureau of Statistics, 1949.

a rapid development during and after that war. Their expansion throughout the decade of the 1920's was rapid. By 1926, the first year for which official estimates are available, United States investments in Canada had a value of \$3,196,000,000 compared with British investments of \$2,636,000,000. During the 1930's some reductions occurred in the amount of external capital invested in Canada.

A further growth in United States investments in Canada took place during the Second World War and, by the end of the War, these investments had reached a new peak, but British investments in Canada were sharply reduced by repatriations of securities. The relative importance in this more recent period of the United States capital inflow in relation to domestic capital formation was less than in earlier periods of capital inflow. Much the larger portion of Canadian developments and activities during the War of 1939-45 were financed from Canadian sources. As a result of the divergent trends in British and United States investments, total non-resident investments in Canada increased only moderately between these years. In 1946 an increase to a total of \$7,178,000,000 occurred, chiefly because of the continued expansion of United States investments in Canada. In 1947 there was a slight change in the total to \$7,174,000,000 because redemptions mainly offset new direct investments and reinvestments of earnings.

Increases occurred in 1948 due to large inflows for direct investment, reinvestments of earnings, and Government borrowing of \$150,000,000 in the United States which latter was larger than the retirements. In 1949 the value of foreign investments expanded further to a provisionally estimated total of \$7,977,000,000 of which \$5,890,000,000 was made up of United States investments and \$1,752,000,000 of British investments. A further expansion in United States and British direct investments in Canada contributed a large part to this increase. Another important factor contributing to the increase was the inclusion in the Canadian totals for the first time of foreign investments in Newfoundland.

The relative position of investments of external capital in relation to total investments of capital in Canada has changed materially in recent years. Non-resident investment now constitutes a smaller part of total investments in Canada than was the case before the Second World War. It is difficult to express this relationship in terms of any simple ratio, however, because of the variety of types of investment which must be compared. Important changes have also taken place in the relative position of different types of investment.

Non-resident holdings of Canadian bonds constitute a much smaller proportion of the outstanding funded debt of Canadian governments and corporations than before the Second World War. The external holdings of Canadian bonds represented only about 13 p.c. of the total Canadian funded debt at the end of 1947 compared with about one-third of the approximate \$10,000,000,000 of bonds outstanding in 1939. The outstanding changes bringing about this transition have been the great rise during the Second World War in the funded debt of the Federal Government, which was largely financed in Canada; and some reduction in the total of Canadian bonds held outside Canada which, in 1939, amounted to \$3,508,000,000 compared with about \$3,029,000,000 in 1949. The reduction in the amount held outside Canada is due to wartime repatriations of Canadian bonds from the United Kingdom. Holdings in the United States and other countries have increased moderately in total since 1939. Non-resident holdings of government issues, exclusive of railway bonds, were 17 p.c. of the total outstanding in 1939 and in 1949 were about 9 p.c. This change has also been partly due to a reduction in the amount of holdings held in the United Kingdom, as well as to the rise in total of internal issues.

Non-resident ownership of Canadian industry, mines, railways, and public utilities is estimated in 1948 to have been about 32 p.c. of total capital invested, a percentage not much different from the corresponding ratio at the beginning of the War.

The ratio of non-resident ownership in Canadian manufacturing companies was somewhat greater than in the case of the broader group of investments referred to, being estimated at about 45 p.c. in 1948. The percentage of different groups of Canadian industry owned abroad varied considerably. This ratio was greatest in the non-ferrous metal industry, being 72 p.c. compared with 25 p.c. in the textile industry in 1946. In other groups of industry non-resident ownership was also high reaching 58 p.c. in the chemical industry in 1946. In still other groups the ratio was between one-third and one-half, including vegetable products, animal products, wood and paper products, iron and its products and non-metallic minerals. Furthermore, in some subdivisions of these industries non-resident ownership and control were predominant even though only the minor parts of the groups, when taken as a whole, were owned abroad. Other important industrial subdivisions are mainly Canadian owned and controlled, e.g., the primary iron and steel and cotton textile industries.

Non-resident ownership of railways is large, being 44 p.c. in 1948. The mining and smelting field has also been developed to an important extent by external capital, the ratio of non-resident ownership being 37 p.c. Some major units in this field are also non-resident controlled. In financial institutions non-resident ownership is substantial but non-resident control is largely limited to branches of foreign insurance companies, as Canadian banks, trust companies, and most Canadian insurance companies are mainly Canadian controlled.

Direct investments by United States concerns in Canada constitute a particularly important part of the total United States investments of \$5,588,000,000 in 1948. These investments in branches, subsidiaries and other companies in Canada controlled in the United States had a value of about \$2,829,000,000 in 1948. Being subject to varying degrees of control and active management by the United States owners these direct investments in more than 2,172 concerns constitute a special group of businesses in Canada which have played a significant part in the industrial development of the country.

The other major group of United States investments in Canada is largely made up of portfolios of minority holdings of public issues of the bonds and stocks of Canadian governments and corporations. Holdings of high-grade Canadian bonds by insurance companies and other institutional investors in the United States constitute an important part of the portfolio investments.

Portfolio investments have been the most typical form of British investments in Canada. Most of the repatriations of recent years occurred in this group, the direct investments remaining relatively unchanged. While the latter are now more important proportionately than formerly they continue to be only a minor part of the total, being valued at \$385,000,000 in 1948 or about 24 p.c. of the total British investments of \$1,593,000,000.

### 5.—Estimated British and Foreign Capital Invested in Canada, by Types of Investment, as at Dec. 31, 1933, 1939 and 1945-48

**Canadian Assets Abroad.**—Canada's external assets have changed greatly in size and composition in recent years. The total value, including holdings of gold and liquid reserves in foreign currencies, has risen from \$1,876,000,000 in 1939 to \$4,277,000,000 at the end of 1948. The principal factor in this increase has been the extension by the Federal Government of loans and export credits to the United Kingdom and other countries. At the end of 1949, the total of Canadian Government credits outstanding was \$2,000,000,000. Included in this total was about \$299,000,000 outstanding on the 1942 loan to the United Kingdom, \$1,035,000,000 drawn on the 1946 loan to the United Kingdom, \$535,000,000 of post-war export credits and advances, and \$31,000,000 of other credits outstanding. In addition, at the end of 1949, official liquid reserves aggregated about \$1,117,000,000, including gold and official United States dollar balances. While these reserves, at that date, were still higher than at the end of 1939 they were less than they were in 1945 and 1946. In addition, Canada had subscribed in 1946 and 1947 to the capital of the International Bank and the International Monetary Fund. By the end of 1947, subscriptions made by Canada to these institutions amounted to \$65,000,000 and \$300,000,000, respectively. A small part of the subscription to the Bank was in the form of convertible exchange and \$75,000,000 of the subscription to the Fund was in gold. The remainder of both subscriptions was made in the form of demand notes of the Federal Government or in Canadian funds.

Besides the officially owned assets referred to above there were the privately owned investments in the form of foreign securities and property owned by Canadian companies and individuals. In 1939, these privately owned assets constituted most of the total value of Canadian assets abroad, whereas, since the end of the Second World War they have amounted to only a minor part of the total, chiefly because of the sharp rise in officially owned assets. Total privately owned portfolio investments abroad have declined in value since 1939 because of the liquidations of Canadian holdings of United States securities. Portfolio holdings of foreign securities owned in Canada have been reduced from \$719,000,000 at the end of 1939 to \$605,000,000 at the end of 1948. This decline is less than the total sales of these securities by private investors during the period, as there was a considerable increase in the book value of holdings of United States stocks. Appreciable gains have occurred in the value of Canadian direct investments in businesses outside Canada which had a value of \$788,000,000 at the end of 1948 compared with \$671,000,000 at the end of 1939.

### 7.—Canadian Assets Abroad, 1939 and 1945-48

NOTE.—Excluding investments of insurance companies.

<sup>1</sup> Includes holdings of gold which, at the end of 1946, had a Canadian dollar value of \$536,000,000 and in 1947, \$287,000,000.

## 8.—Estimated Canadian Investments Abroad, as at Dec. 31, 1949

NOTE.—Excluding investments of insurance companies, banks, government credits, and liquid reserves. Holdings of stocks are at book values as shown in the books of issuing companies; holdings of bonds are shown at par values. Foreign currencies were converted into Canadian dollars at current market rates.

Location of Investment	Direct Investments \$'000,000	Portfolio Investments			Total Investments \$'000,000
		Stocks \$'000,000	Bonds \$'000,000	Total \$'000,000	
United States.....	684	345	98	443	1,127
United Kingdom.....	60	21	19	40	100
Other Commonwealth countries.....	76	6	8	14	90
Other foreign countries.....	73	105	36	141	214
<b>Totals.....</b>	<b>893</b>	<b>477</b>	<b>161</b>	<b>638</b>	<b>1,531</b>

The privately owned Canadian investments abroad are chiefly in the United States, the total value of investments in that country at the end of 1949 being \$1,127,000,000. At the same time investments in other foreign countries, chiefly in Latin America, were \$214,000,000, while investments in the United Kingdom were \$100,000,000, and in other Commonwealth countries \$90,000,000. These figures of investments exclude the investments abroad of Canadian insurance companies and banks, as well as the official assets referred to above, and certain small amounts of miscellaneous investments that are difficult to evaluate.

## Section 3.—Corporation Profits and Income to Shareholders

Estimates of corporation profits presented here cover all Canadian corporations. The figures for the years 1944 to 1948 are based on the reports "Taxation Statistics" published by the Taxation Division, Department of National Revenue; but in years prior to 1944 corporation profits were estimated on the basis of data on tax collections and tax rates supplied by the Department of National Revenue.

Profits are shown both before and after income and excess profits taxes, in order to emphasize the importance of the tax rate in determining the profits available to corporations for dividends and surplus. The income tax rate which was 15 p.c. in 1939 was increased to 18 p.c. in 1940 and to 30 p.c. in 1947; effective Jan. 1, 1949, the rate for the first \$10,000 of profits is 18 p.c., and for all profits in excess of \$10,000 it is 33 p.c. From 1940 to 1947 corporations were also subject to a tax on excess profits, details of which are given in the 1950 Year Book.

Corporation profits before taxes and dividends reached a wartime peak in 1942, declined in 1943 and in 1944, and then rose to an all-time high of \$1,969,000,000 in 1948. The 1949 estimate of \$1,914,000,000 was lower than the 1948 high but well above any other year. The increase from 1939 to 1948 was 219 p.c. while the drop from 1948 to 1949 was 3 p.c.

Tax collections rose sharply from 18 p.c. of profits in 1939 to 40 p.c. in 1940 and remained between 40 p.c. and 50 p.c. of profits until 1948 when the percentage dropped to 36. In 1949 tax collections were 35 p.c. of profits. Profits after taxes increased from \$506,000,000 in 1939 to \$1,241,000,000 in 1949 or by 145 p.c. These figures of taxes levied do not include the refundable portion of the excess profits tax.

Dividends paid to stockholders remained fairly constant from 1939 to 1945. The years 1946 to 1949 all showed substantial increases in dividends paid. It should be noted that the figures for dividends paid do not include dividends paid to

Canadian corporations since intercorporate dividends cancel out for the corporate sector as a whole. Undistributed profits, that is, profits after taxes and dividends, were \$627,000,000 in 1949, a decrease of \$91,000,000 from the 1948 figure of \$716,000,000. This drop was caused by a decline of \$18,000,000 in profits after taxes and an increase of \$73,000,000 in cash dividends and charitable donations paid out. The large surpluses of recent years in combination with the growing depreciation reserves put corporations in a favourable position to replace and extend capital equipment and to build up inventories.

### 9.—Profits, Taxes and Dividends of Canadian Corporations, 1939-41 and 1943-49

(Millions of dollars)

NOTE.—Corporate profits before taxes include corporate taxable income, depletion charges and charitable donations, and are adjusted for corporate losses, renegotiation of war contracts, and conversion to a calendar year.

Item	1939	1940	1941	1943	1944	1945	1946	1947	1948	1949 <sup>1,2</sup>

<sup>1</sup> Subject to revision.

<sup>2</sup> Exclusive of Newfoundland.

<sup>3</sup> National income estimate.

See Table 11 for adjustment for taxable profits.

### Analysis by Industries

Data on profits by industries are available only for the years 1944 to 1948, inclusive. Corporation profits as shown in Table 11 do not agree with those in the National Accounts since the national accounts figures include depletion charges and charitable donations and adjustments are made for renegotiation of war contracts and for conversion to a calendar year basis.

Since 1944, almost all industrial groups have shown large increases in profits before taxes. The groups which showed the largest percentage increases from 1944 to 1948 were the other public utilities group (339 p.c.), construction group (240 p.c.), pulp and paper (195 p.c.), wood and wood products (194 p.c.), other metal mining (159 p.c.), and non-metallic mineral products (116 p.c.). Five groups showed a decline in profits between 1944 and 1948, the most significant of these being the transportation equipment manufacturing group and the communication and storage group whose profits declined by 52 p.c. and 29 p.c., respectively.

Between 1947 and 1948 the largest increases in profits before taxes were in the construction group (93 p.c.), other public utilities group (68 p.c.), fishing group (67 p.c.), and the transportation equipment (except automobiles) group (54 p.c.). Of the nine groups which showed declines between 1947 and 1948 the most significant were the rubber and leather groups.

Profits after taxes show much the same trend as profits before taxes except that the drop in the tax rates from 49 p.c. of profits in 1944 to 36 p.c. of profits in 1948 resulted in the average percentage increase in profits after taxes being more than double the increase before taxes.

### 10.—Corporation Profits, Before and After Taxes, by Industries, 1944 and 1946-48

NOTE.—Figures are for the company fiscal years ended in the calendar years 1944 and 1946 to 1948. The source of information is "Taxation Statistics" published annually by the Taxation Division, Department of National Revenue, Ottawa.

<sup>1</sup> Estimated refundable excess profits taxes of \$68,600,000 in 1944 and \$17,800,000 in 1946 were not included in taxes deducted.

<sup>2</sup> Total profits of all corporations, as presented in Table 10, differ from the total of all corporations as shown here since, for national income purposes, charitable donations and depletion charges are added back to profits and adjustments are made for renegotiation of war contracts and conversion to a calendar-year basis.

### Section 4.—Estimates of National Wealth

No official estimate of national wealth has been made since that of 1933. Latterly great emphasis has been placed on developing up-to-date series on national income and time has not permitted extensive work on national wealth. A short summary of the position at that time is given at pp. 795 and 796 of the 1942 Year Book.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Agriculture, including stock raising and horticulture, is the most important of the primary industries of the Canadian people, employing, according to the Census of 1941, 25·2\* p.c. of the total gainfully occupied population and 30·5\* p.c. of the gainfully occupied males. In addition, agriculture provides the raw materials for many Canadian manufactures, and its products in raw or manufactured form constitute a very large percentage of Canada's exports. The present and potential agricultural land is shown by provinces at pp. 27-28 of this volume.

### Section 1.—Federal Government in Relation to Agriculture†

The creation of the Department of Agriculture is provided for in Sect. 95 of the British North America Act (1867), which says in part that "in each province, the legislature may make laws in relation to agriculture in the province" and that "the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the legislature of a province relative to agriculture, shall have effect in and for the province as long and as far as it is not repugnant to any Act of the Parliament of Canada". As a result of this provision, there exists at the present time a Department of Agriculture, with a Minister of Agriculture at its head, in the Federal Government and in each of the provinces, except Newfoundland where agricultural affairs are dealt with by the Agricultural Division of the Department of Natural Resources. The Federal Department was established in 1868.

At present there are four main fields of activity: (1) general policy, including security and price stability; (2) research and experimentation; (3) maintenance of standards and protection of products; and (4) reclamation and development.

\* Including persons on Active Service normally employed in agriculture.

† Except as otherwise indicated, this material was prepared under the direction of J. G. Taggart, C.B.E., D.Sc., Deputy Minister of Agriculture.

Policies and projects of the Department conducted under these four broad headings are co-ordinated within the Department and with similar work done by other departments and institutions, both federal and provincial. The results of work in these various fields and information on the policies of the Department in general are given to farmers and the public through bulletins, the press, radio and the screen.

Generally, Canadian farmers entered 1950 in a strong financial position. At no time has farm investment been on a sounder foundation. Many long-term commitments have been liquidated, or have been considerably reduced, and a large quantity of farm machinery and equipment has been acquired, mostly for cash or on large down-payments. Farmers have never been so well represented as they are to-day through national and provincial organizations and co-operatives; nor have they been so well protected by measures for security in marketing as they are by legislation passed by Parliament in the past decade.

### Subsection 1.—General Policy and Price Support

**Export Contracts.**—During the War and immediate post-war years, Canada supplied the United Kingdom with vast quantities of food and agricultural supplies under annual agreements between Governments. These agreements now cover fewer commodities and smaller quantities. The contracts for 1950 are as follows:—

*Bacon.*—The contract for the calendar year is for approximately 60,000,000 lb. Grade A Wiltshire at \$29 per cwt. f.o.b. Canadian seaboard. The bacon is being purchased at \$32.50 per cwt. and the difference of \$3.50 is defrayed by the Government.

*Cheese.*—This agreement calls for the shipment of 85,000,000 lb. of cheddar cheese at 25 cents a pound f.a.s. Canadian seaboard. The cheese is being purchased at 28 cents, and the difference of 3 cents is being paid by the Canadian Government.

*Wheat.*—Exports of wheat are administered by the Canadian Wheat Board. The five-year agreement with Great Britain terminated on July 31, 1950, with the shipment of 140,000,000 bu. from the 1949 crop and thereafter wheat will be exported in accordance with the International Wheat Agreement. The initial price for the 1950-51 crop will be \$1.40 per bushel for No. 1 Northern in store Fort William-Port Arthur or Vancouver. The final price which producers will receive depends upon the international wheat situation as it develops and the success of the Wheat Board in selling wheat at the best available prices.

*Oats and Barley.*—The initial prices for oats and barley from the 1950-51 crop remain as for the previous year; No. 2 Canada Western oats in store Fort William-Port Arthur, 65 cents a bushel, and for No. 3 Canada Western six-row barley in store Fort William-Port Arthur, 93 cents a bushel.

**Agricultural Prices Support Act.**—One of the most important pieces of farm legislation enacted within recent years is the Agricultural Prices Support Act, which enables the Federal Government, acting through a Board, to support the price for an agricultural product—except wheat which is handled separately

through the Canadian Wheat Board. The Board can recommend assistance or support by either of two methods: (1) outright purchase, (2) underwriting the market through guaranteed or deficiency payments. The Act, though passed in 1944, did not operate until 1946. Since that time assistance has been extended in the marketing of apples, potatoes, dried white beans, honey, butter, dried skim milk, cheddar cheese, pork products and eggs. The support of farm prices should be, and is, used in Canada to stabilize prices in the interests of both producer and consumer. It is a means of equalizing the standard of the rural worker on a level with the 55 p.c. of Canadians who live in the towns and cities. The Act as originally drafted was on an annual basis, subject to renewal by Parliament every 12 months. In 1950, the renewal clause was dropped and the measure was approved as a permanent feature of Government policy.

**Agricultural Products Co-operative Marketing Act, 1939.**—This Act aids farmers in pooling returns from the sale of their products by guaranteeing initial payments and thus assisting in the orderly marketing of the product. The legislation has been used extensively by co-operatives, and agreements throughout the years have covered onions, potatoes, corn, many seed crops, and ranch-bred fox and mink pelts.

**The Agricultural Products Marketing Act, 1949.**—A number of provincial governments have marketing legislation which provides for the establishment of marketing boards to regulate or control the marketing of agricultural products produced and marketed within the province. The Parliament of Canada in 1949 passed the Agricultural Products Marketing Act which provides that such provincial marketing legislation may be applied in the same way to cover the marketing of agricultural products outside the province and in export trade.

**Agricultural Products Act, 1947.**—The purpose of this Act is to provide for negotiating export contracts with other countries. The Dairy Products Board, the Meat Board and the Special Products Board obtain authority for their operations under the terms of the Act.

**Prairie Farm Assistance Act, 1939.**—Under the Prairie Farm Assistance Act, 1939, the Federal Government makes cash payments each year to farmers in areas within the Prairie Provinces that have had low crop yields because of drought or other causes. The award to a farmer is based upon the acreage of the farm and the average yield of wheat in the township in which the farm is located. The maximum amount payable on any one farm is \$500. Contributory payments are made by the farmers in the form of a levy of 1 p.c. on the value of all grains marketed. Additional amounts required are provided from the Consolidated Revenue Fund.

**Potato Warehouses.**—A policy was inaugurated in 1947 whereby the Federal Government provides cash assistance in respect to potato warehouses constructed by co-operative associations. The assistance is conditional upon the association providing an agreed amount, the Federal and the Provincial Government concerned sharing the remainder. All warehouses must have the approval of a Dominion-Provincial Committee set up for the purpose in each province in which warehouses are to be built under this policy.

**Cheese and Cheese Factories.**—The Cheese and Cheese Factory Improvement Act was passed in 1939 to encourage the improvement of cheese and cheese factories. Under the provisions of this Act a quality premium of one cent per pound is paid on cheddar cheese scoring 93 points and two cents per pound on cheese scoring 94 points or over.

The Governor General in Council may grant, out of money appropriated by Parliament for the purpose, a sum not exceeding 50 p.c. of the amount actually expended for new material, new equipment and labour utilized in constructing, reconstructing and equipping cheese factories that are eligible for a subsidy under the Act and regulations. This subsidy applies for the amalgamation of two or more existing cheese factories provided that the replaced cheese factories cease to operate as such prior to the payment of the grant. The Act also provides for paying 50 p.c. of the cost actually expended in efficiently insulating and enlarging cheese-curing rooms, either with or without mechanical refrigeration. In order to standardize the size of cheese manufactured in the various factories, the Act provides for paying 50 p.c. of the cost of replacing cheese hoops where factories are using hoops of a diameter other than 15 inches. Frequently when the factory adopts the 15-inch hoop, the presses, followers and bandagers have to be adjusted or replaced, and such costs are also included in the subsidy.

**Cold Storage Act.**—This Act provides financial assistance in the construction of public cold-storage warehouses in localities where it is considered that such warehouses are in the interests of the public.

**Farm Credit.\***—To provide adequate farm credit, the Canadian Farm Loan Board at present carries on lending operations throughout Canada. The purposes for which loans may be granted are for farm improvements, including the erection of buildings, the purchase of live stock and equipment, farm operating expenses, purchase of farm lands and the refinancing of existing farm indebtedness. Second-mortgage loans cannot be made for the purpose of purchasing farm lands. For intermediate-term credit, the Federal Parliament amended the Bank Act (Aug. 9, 1944) and passed a "companion" Act, the Farm Improvement Loans Act, 1944. This has been used extensively for short-term loans, particularly for the purchase of farm machinery.

From the commencement of operations in 1929 to Mar. 31, 1949, the Board made 30,844 first-mortgage and 10,146 second-mortgage loans for a total amount of \$65,323,093 disbursed. Of this amount, \$40,203,004 has been repaid. At Mar. 31, 1949, the principal assets of the Board amounted to \$24,447,281 made up as follows: 15,006 first-mortgage loans, \$23,175,418; 1,836 second-mortgage loans, \$884,387; 277 sale agreements, \$373,635; and 12 parcels of real estate, \$13,841.

The average amount lent annually during the first ten years of operations was \$3,860,000. The amount of loans approved dropped from \$4,348,950 in 1940 to \$1,215,450 in 1943 but, since then, has increased steadily to \$4,919,300 in 1949. The trend in recent years is toward decreased borrowing to pay debts and increased borrowing to purchase land and farm equipment.

\*Statistics under this heading were provided by W. A. Reeve, Secretary, Canadian Farm Loan Board, Ottawa.

The main forms of financial assistance provided at the present time by the Federal Government to farmers for housing purposes include: the Canadian Farm Loan Board outlined above, the National Housing Act and the Farm Improvement Loans Act dealt with under Construction, and the Veterans' Land Act, under Veterans' Affairs (see Index).

### Subsection 2.—Agricultural Research and Experimentation

In its efforts to aid the farmer in the solution of his problems, the Department of Agriculture conducts, on a broad scale, scientific research and experimentation on the control of pests and diseases, the nutritional requirements of plants and animals, the breeding and testing of new varieties, the microbiology of soils and foods, investigations of crop production and cultural methods and many other matters.

The two main divisions of the Department that carry on such work are the Science Service and the Experimental Farms Service. A somewhat detailed description of the work of the Science Service appeared in the Canada Year Book 1950, on pp. 406-409, and an outline of the organization and accomplishments of the Dominion Experimental Farms will be found at pp. 349-352 of the 1948-49 edition.

### THE MAJOR SOIL ZONES AND REGIONS OF CANADA\*

The nature and distribution of the different soils in Canada is governed by a number of major soil-forming factors, the most important of which are: climate, vegetation, soil parent materials, drainage and relief and the age of the soil. In many of the more intensely developed agricultural areas the natural characteristics of the soil have been modified to a greater or less extent by man. On the basis of general similarities between soils and on the basis of the general pattern that different kinds of soils form, a number of major soil zones and regions have been recognized in Canada. These major zones are outlined on the map facing p 356.

One of the most important soil boundaries in Canada corresponds closely to the southern limits of the Precambrian Shield. The area to the north of this line covers approximately 50 p.c. of the land surface but the extent of land suitable for agriculture in this region is very limited. The Cordilleran region, in which agricultural development is confined mainly to the more fertile valleys and the smoother plateaux, covers approximately another 14 p.c. of Canada's land surface.

Most of the soils suitable for agriculture lie south of the Precambrian Shield and to the east of the Cordilleran Region. This area has been subdivided into a number of different soil zones and regions. The zones generally coincide closely with broad climatic and vegetative regions and hence the types of agriculture that can be practised and the kinds of crops that can be grown successfully are related to the major soil zones. Many of the soils within a zone have certain common characteristics typical of the particular zone. These "zonal" soils often form characteristic land patterns with other local soils which may differ considerably in some particular features.

In the area south of the Precambrian Shield there are three major soil zones in the region where grasses were the dominant natural vegetation. These three zones have been designated, after the prevailing colour of the surface soils, as: Brown, Dark Brown and Black Soil Zones. The forested region south of the Shield has been subdivided into six soil zones or areas which are: Degraded Black, Grey-Wooded, High Lime, Grey-Brown Podzolic, Grey-Brown Podzolic-Podzol Transition and Podzol Zones.

**Brown Soil Zone.**—This Zone occurs in the drier sections of the three Prairie Provinces which have a native vegetation of short grasses. It covers approximately 34,000,000 acres. The typical surface soil is brown in colour and is on the average thinner and lower in organic matter and nitrogen than any of the other prairie soils. The soils may vary in texture from sand to clay. A layer of lime accumulation is generally found at depths from 6 to 12 inches. Poorly drained depressions in this Zone are generally saline. Solonchic soils (with heavy, compacted subsurface horizon or hard pan and with salty subsoils) are frequently found in this Zone.

The heavier soils in this Zone are generally used for wheat production, while much of the lighter land is devoted to cattle ranching. Irrigation is more effective than in any of the other soil zones in the grassland region.

\* Prepared by P. C. Stobbe, Senior Pedologist, Central Experimental Farm, Ottawa, Ont.

**Dark Brown Soil Zones.**—This Zone has somewhat better moisture conditions than the Brown Zone and the native vegetative cover is also somewhat heavier. It occurs in a belt surrounding the Brown Zone and covers approximately 30,000,000 acres. The typical surface soils are dark brown or chestnut in colour and contain somewhat more organic matter and nitrogen than the brown soils. The average thickness of the surface soils is also greater and the lime layer usually occurs at a depth of 10 to 18 inches. Solonetzic soils are quite common in many parts of this Zone and saline soils are found in many depressions.

The heavier soils of this Zone rate among the best wheat soils of Canada, while a considerable proportion of the rougher and higher land is utilized for grazing. The type of farming in this Zone is in general similar to that followed in the Brown Zone, although more favourable climatic conditions permit a somewhat more diversified agriculture.

**Black Soil Zone.**—The climate of the Black Soil Zone is sub-humid and the native vegetation consists of tall grasses interspersed with clumps of shrubs and trees. This Zone surrounds the Dark Brown Zone and covers approximately 42,500,000 acres. The typical surface soils, which may vary from 4 inches to 2 feet in depth, are very dark brown to black in colour and rich in organic matter and nitrogen. The lime layer generally occurs at a depth of 15 to 36 inches. Solonetzic and saline soils occur locally in this Soil Zone but they are not as common as in the Dark Brown and Brown Zones. In many of the local depressions, which are or were covered with trees, the soils have a grey surface soil. These soils are generally in poor physical condition and are less fertile than the better-drained dark soils. They are generally referred to as "depression" or "slough" podzols.

The typical black soils are very fertile. In addition to their greater fertility the more favourable climatic conditions in this Zone permit a more diversified type of agriculture than on the soils of the two other grassland zones.

**Degraded Black Soil Zone.**—The Degraded Black Soil Zone forms a transition belt between the Black and the Grey-Wooded Soil Zones. The native vegetation is mainly forest with some small local areas of tall grasses. The soils of this Zone vary locally from the typical black to the grey-wooded soils. However, most of the surface soils are "grey-black" in colour, i.e., intermediate between the two extreme types. Depression podzols or peat occur in the poorly drained depressional areas. Solonetzic soils may also be found locally.

The typical grey-black or degraded black soils, although quite productive, are generally somewhat lower in natural fertility than the soils of the Black Zone. The soils and the climatic conditions in this Zone are well suited to diversified farming.

**Grey-Wooded Soil Zone.**—The Grey-Wooded Soil Zone is the most extensive of all the soil zones south of the Shield. It lies in a cool semi-humid to semi-arid climatic region, with a total average annual precipitation varying from 22 to 12 inches. The native forest vegetation consists largely of poplar, willow, spruce and pine.

The dominant soils of this Zone have a light grey surface layer below a thin dark leaf mould. The brown or brownish grey subsurface soil is generally considerably heavier than the grey surface soil and the layer of lime accumulation usually occurs at a depth of 2 to 4 feet. In addition to the above soils degraded

black types may occur locally in open meadows and in park areas. Depression podzols, peat and muck occur in many poorly drained depressions and solonchaks soils may also be found locally on certain kinds of mineral materials.

The grey-wooded soils are considerably lower in fertility than the degraded black and the grassland soils. They are particularly low in organic matter and nitrogen. Their reaction is generally slightly acid. Due to their lower fertility levels these soils deteriorate rapidly under continuous grain growing. The production of legumes and grasses in conjunction with mixed farming and the use of fertilizers is essential for the improvement and maintenance of the productivity of these soils.

**High Lime Soil Zone.**—The distribution of this Zone in Manitoba and Saskatchewan is largely determined by the highly calcareous nature of the drift material and the close proximity of limestone bed rock to the surface of the soil, rather than by climatic factors or vegetation. The soils in this area vary considerably and they may consist of grey-wooded, degraded black and black types but in most cases shallowness over limestone and the highly calcareous nature of the soil are the major characteristics governing the use of the land. Many of the local depressions in this area are filled with peat and muck.

The productivity of the high lime soils is generally low and the crops often suffer from drought and from phosphorus deficiency. Some of the soils are better suited for certain crops, such as alfalfa for seed production, than for general farming. A large percentage of the soils in this area is marginal or submarginal agricultural land.

**Grey-Brown Podzolic Soil Zone.**—The Grey-Brown Podzolic Zone occurs in southern Ontario where it occupies approximately 15,000,000 acres. The soils of this Zone have developed in a humid-temperate climate under a deciduous or mixed forest cover. The typical well-drained soils have a greyish-brown, mildly acid surface soil, a brown, somewhat heavier sub-surface horizon and a calcareous, greyish subsoil. They may vary widely in texture. The imperfectly to poorly drained soils of this Zone, often referred to as "dark-grey gleisolic" soils, are generally darker in colour, are somewhat higher in reaction and lack the brown sub-surface horizon. Black muck and peat occur in many of the more poorly drained depressions.

The soils of this Zone, although not as fertile as some of the soils in the grassland region, are quite productive when properly managed and fertilized. Under the favourable climatic conditions prevalent in this Zone diversified types of farming may be practised on the different soils. Certain soils are best adapted to dairying, others to mixed farming, while some are particularly well suited for special crops, such as fruit-growing, market-gardening, tobacco growing, etc.

**Grey-Brown Podzolic-Podzol Transition Zone.**—This Transition Zone lies in the St. Lawrence and Ottawa lowland-area of eastern Ontario and Quebec where it occupies approximately 10,000,000 acres. The climate of this area may be designated as humid-temperate. It is somewhat more humid and cooler than that of the Grey-Brown Podzolic Zone. The natural tree cover varies locally from deciduous to coniferous according to site.

The most important soils of this Zone are of the dark-grey gleisolic type. They are generally heavy in texture and imperfectly drained. In addition to these a large variety of other soils are found in this area depending on the nature of the

parent materials and on drainage conditions. Grey-brown podzolic and brown forest soils are found on calcareous materials, mainly in the western section of the area, while brown podzolic and podzol soils occur on the lighter non-calcareous materials. The latter types are found on most of the sandy materials. In addition to the above, black muck and peat soils are found in many of the poorly drained depressional areas.

The fertility of the soils in this transitional area varies greatly. The grey-brown podzolic and brown forest soils are moderately fertile and well supplied with lime, while the brown podzolic and podzol soils are considerably less fertile and moderately-to-strongly acid. The dark-grey gleisolic soils are very productive when properly drained and managed, while the black muck soils are highly productive when devoted to special garden crops. Many of the poorly drained sandy soils and shallow soils over bedrock are not suited for agricultural development. The crop adaptability of the different soils also varies considerably and consequently different types of farming can be practised in this Zone.

**Podzol Zone.**—This Zone of soils extends through the Maritime Provinces (not including Newfoundland) and eastern Quebec. It covers an area of over 50,000,000 acres of land. The soils in this area have developed under a humid climate and under a coniferous or a mixed-forest cover.

The dominant well-drained soils in this Zone are podzols which, under forested conditions, have a light grey or white leached layer near the surface immediately below the leaf mat. This layer in turn is underlain by a yellowish or reddish brown subsurface horizon. Under cultivated conditions the surface soil is generally reddish or greyish brown. The imperfectly and poorly drained soils in this Zone are either more leached than the well-drained soils, in which case they have a thicker light-grey horizon near the surface, or they may be less leached in which case they have a dark surface soil. Many of the poorly drained depressions have a covering of peat, while black muck seldom occurs in this Zone.

The natural fertility levels of the podzol soils are not very high and the reaction of these soils is moderately-to-strongly acid. Good farm practices involving the use of lime, manure and fertilizers, as well as suitable rotations are essential in order to maintain the soil in a good state of productivity. Mixed farming is generally best suited to the soils in this Zone, although commercial potato-growing and orcharding are well adapted in certain areas. A considerable percentage of the soils in the Podzol Zone are marginal and sub-marginal from an agricultural standpoint.

**The Cordilleran Region.**—In the Cordilleran Region the largest part of the land area consists of rough mountainous land. However, comparatively small areas of agricultural or potentially agricultural land are found scattered in some of the valleys and on the smoother plateaux. Within the Cordilleran Region climatic conditions and the natural vegetation vary greatly. The geological soil parent materials also vary greatly. As a result a wide range of soils may be found in this Region which cannot be shown on a small-scale map.

In the drier valleys of southern British Columbia, brown, dark brown and black grassland soils, respectively, are found as one proceeds up the valley slopes. Grassland types of soils are also found on some of the dry uplands. On many of the higher places podzolic soils are common and grey-wooded and degraded dark soils are dominant on the smooth plains of the central interior. In the lower Fraser Valley imperfectly drained dark-grey gleisolic soils, which resemble those

of the St. Lawrence Lowland, are common. Along the southwestern coast of British Columbia, under warm, humid climatic conditions, brown soils occur which have a close resemblance to the brown podzolic soils of Eastern Canada. They are indicated on the map as Pacific Coast Soils.

The fertility of the soils in the Cordilleran Region varies greatly. This, together with the range in climatic conditions, permits a great diversity in the types of agriculture which can be practised in British Columbia.

**The Precambrian Region.**—The soils on the Precambrian Shield are greatly influenced by the thin covering of unconsolidated soil material over hard bedrock and by the nature of these materials. Large areas of rock outcrop occur frequently on the Shield, while peat and swamp fill many of the depressions. As a result of the influence of climatic conditions the associated soil pattern of this broad region may be roughly divided into two.

In the southernmost part, in addition to the rock outcrop and peat, brown podzolic and podzol soils occur on the upland. This area also contains the smooth plains of the northern Ontario and Quebec Clay Belt and of the Lake St. John District in Quebec. The clay soils in the latter district are mainly of the dark-grey gleisolic types and resemble those of the St. Lawrence Lowland. The better-drained soils of the Ontario and Quebec Clay Belt resemble in general the grey-wooded soils. A large percentage of the soils in this belt are poorly drained and have a thin covering of peat. Most of the agricultural development on the Shield is found in the two clay plains and along the southern rim of the Shield, particularly in the river valleys.

In the northern forested part of the Shield and in some of the forested areas underlain by other rock formations, the percentage of peat and swamp in the landscape is greater than in the southern part. In this area a large percentage of the soils is underlain by perma-frost. These sub-arctic soils may thaw out to various depths during the growing season. The agricultural development in this region is limited mainly to gardens in the more favourable locations.

**The Tundra Region.**—To the north of the forested region lies an extensive belt of treeless tundra. The sub-soils in the tundra are permanently frozen and only the surface thaws out to shallow depths. Very little weathering has taken place in these soils. The tundra soils may vary considerably depending on the kind of mineral material from which they have formed. Those found on the Shield are invariably coarse textured and acid, while those found on Palæozoic limestone are heavier and invariably neutral or alkaline.

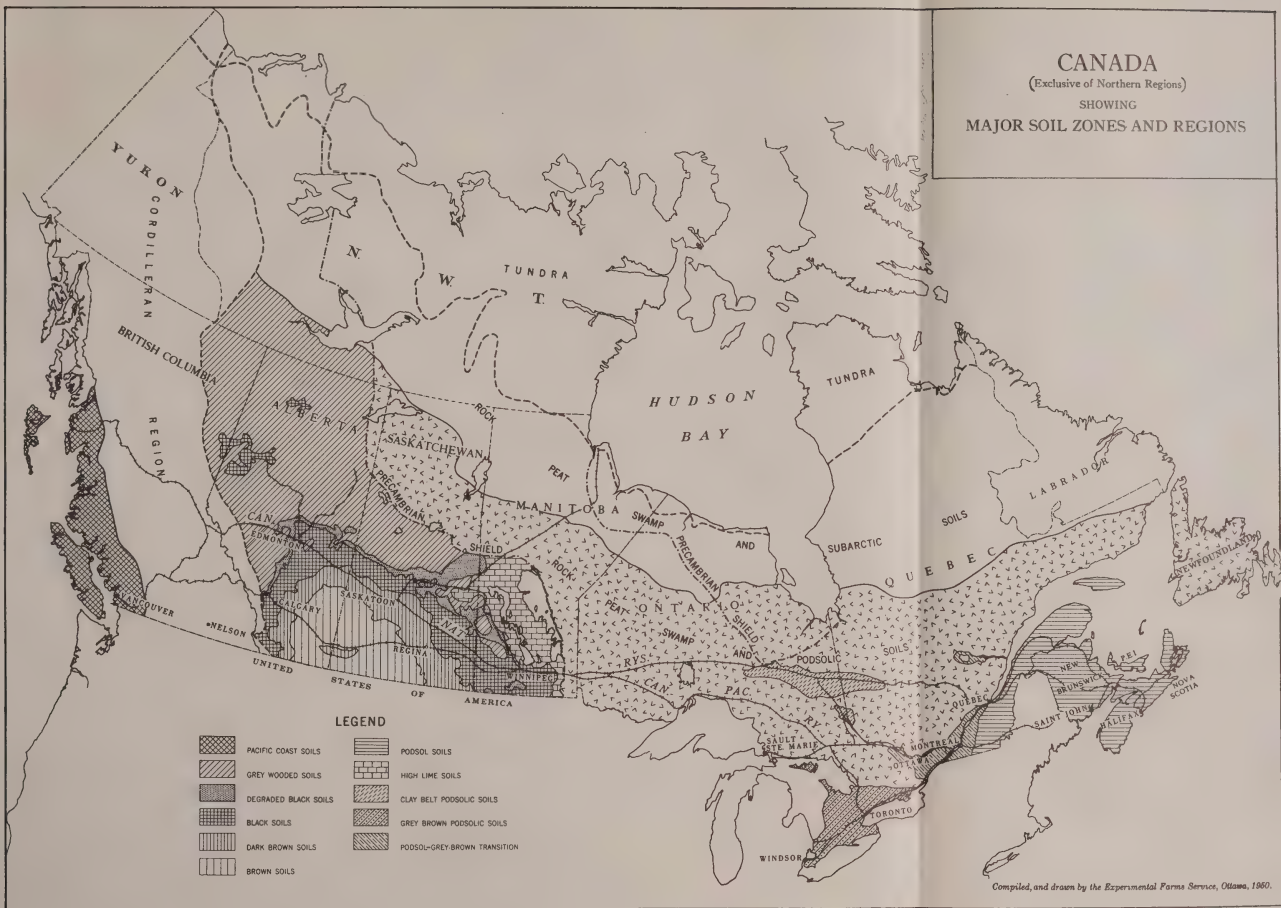

There is no agricultural development on the tundra but some districts are utilized for reindeer grazing.

### Subsection 3.—Protection and Grading

Unlike manufactured products, even close scrutiny of most agricultural products is no clue to their purity as food, or their value to the farmer for further production. Obviously, products that are eventually used as food must be pure and healthful and must live up to standards of quality established for them. On the other hand, if agriculture is to be on a sound basis, the things farmers buy—seeds, feeds, fertilizers and pesticides—must also carry some guarantee that they will be as represented. Much of the research and experimental work would go for naught if legislation were not provided to see that the end-product of such work was satisfactory. In

CANADA  
(Exclusive of Northern Regions)  
SHOWING  
MAJOR SOIL ZONES AND REGIONS

addition, Canada's live stock, crops and trees must be protected from diseases that might be introduced with importations from other countries, or that might originate in Canada.

These protective and grading services are a most important part of the work of the Department of Agriculture. They come under two sections, the Production Service and the Marketing Service, and the necessary authority is gained from about 20 Acts or their regulations. Generally, the protective features and the grading to standards or approval of analyses of farm supplies, such as seeds, feeds, fertilizers and pesticides, come under divisions of the Production Service. The grading of most food products comes under divisions of the Marketing Service. The line of demarcation is naturally not rigidly drawn, the aim being ease and economy of operation. A brief review of this work follows.

**Health of Animals.**—A most important protective service is the one that guards the health of Canada's live stock. Contagious diseases which could well sweep the country and decimate live-stock numbers, might easily be introduced into Canada from foreign lands. It is to guard against such calamities that veterinarians of the Health of Animals Division enforce the stringent regulations covering the importation of live stock, live-stock products and even packing material and litter. Provision is also made for the control or eradication of animal diseases within Canada. This Division is responsible for the inspection of animals slaughtered for food, and post-mortem examination is made on all carcasses in the course of slaughter and dressing before the meat is approved for human consumption. Sanitary conditions in packing plants and slaughter houses come under review and all canned meats must meet high standards of processing to qualify as food.

**Protecting Supplies.**—The Plant Products Division is primarily concerned with the administration of Acts respecting feeding stuffs, fertilizers, pesticides, hay and straw, fibre flax and binder twine, and the production of seed in co-operation with the provinces and other agencies.

The inspection services of this Division have three main functions: (1) to enforce the Acts that regulate the sale of the agricultural supplies previously mentioned; (2) to provide as required the services of seed-crop inspection and the sealing of seed produced from inspected and other approved crops; (3) to co-operate with provincial governments and other agencies in promoting and improving supplies of seeds, feeds, fertilizers and pesticides.

Visual inspection is of little value for most of these products and laboratory testing is necessary. This is done by the laboratory services of the Division with branch offices across Canada. In the case of seeds it is quite a complex matter, for they must be tested for germination, variety, purity and freedom from weeds and other kinds of seeds before they are finally graded. All feeding stuffs, fertilizers and pesticides are subject to registration, and this is refused if products would be dangerous in use, if the ingredients or analyses are unsatisfactory, or when the claims made regarding their value are incorrect or misleading.

**Plant Protection.**—The Division of Plant Protection functions with regard to plants and plant products much as the Health of Animals Division does with animals and administers the Destructive Insect and Pest Act. Imported nursery stock and plant material are all subject to inspection against the introduction of insects and diseases. Extensive inspection is maintained within Canada to identify, localize and exterminate dangerous enemies of crops and trees. Provision is also

made for the inspection of potato crops for seed, both for domestic and export use, and for the issuance of health certificates as required for a wide range of plant products.

**Standards and Inspection.**—For 50 years or more, the Department has been steadily establishing and improving standards of quality for agricultural products. This work originated in an effort to improve the quality of export commodities and has gradually extended to include many products that move in interprovincial trade. The provinces have in most cases adopted these standards for enforcement within their respective areas on products marketed intraprovincially.

The Department establishes and enforces grade standards for dairy products, meats, eggs and poultry, fruits and vegetables—including canned and processed, and seed. Grade standards are widely recognized outside Canada and many Canadian foods and agricultural products command premium prices because of the strict quality standards maintained.

**Dairy Products.**—The grading and inspection services of the Dairy Products Division is somewhat typical of other sections of the Marketing Services engaged in such work. Cheese, butter and dry skimmed milk must be graded before being exported; in practice this means practically all the cheddar cheese, 60 p.c. of the creamery butter and 82 p.c. of the dry skimmed milk. In addition, creamery print butter is branded as to grade in most provinces. Dairy products are required to meet standards of composition, be of correct weight or volume and be described accurately in accordance with the provisions of the Dairy Industry Act and regulations thereunder. In the case of condensed, evaporated and dried milk products, technical assistance is given on manufacturing and sanitation problems.

**Meats.**—The inspection and grading of meats is an important part of this work, in addition to the approval of the carcass for human consumption. All hogs marketed at yards and plants are rail graded, that is, the farmer is paid on the dressed weight and quality of the carcass. Export bacon is inspected as well as other meat and meat products. The better grades of beef are marked according to standards of Choice and Good beef, making them eligible as Red and Blue brands, respectively. Lamb carcasses are graded on an optional basis, and wool is inspected and graded in some 28 registered wool warehouses.

**Eggs and Poultry.**—Registered egg-grading stations are the basic units in the grading and packing of eggs, and registered poultry-processing and eviscerating stations are the basic units in the processing, eviscerating, grading and packing of poultry. These stations have been brought to a high standard of efficiency with regard to sanitation, equipment, temperature control, grading and packaging.

Inspection of eggs and poultry is compulsory on all sizable quantities intended for export and interprovincial shipment. These products are also check-inspected periodically for grade when offered for sale at wholesale and retail. The sale of eggs by grade, at retail, is compulsory throughout Canada, and the sale of poultry by grade, at retail, is compulsory in the larger consuming centres.

Canned boneless poultry for interprovincial and export shipment must be packed according to grade and prepared in registered canneries. Registered poultry canneries also operate on a high standard of efficiency with respect to sanitation, temperature control, cooking procedure, packaging, etc.

*Fruits and Vegetables.*—A commercial inspection service covering fresh fruits and vegetables is provided and dealers and brokers handling these commodities in interprovincial, export and import trade are licensed and are subject to the regulations under the appropriate Act.

The fruit and vegetable canning and processing industry has made great strides in the past quarter-century. In 1949 over 500 plants were in operation which produced processed fruits and vegetables valued at \$175,000,000. The inspection of these plants, the testing of the products and the grading is done by the Canning Section of the Fruit and Vegetables Division.

*Maple Products and Honey.*—Regulations are established for the inspection, analysis and grading of these products. Sugar-bush licences are issued and interprovincial and export shippers of honey are registered. To prevent the possibility of adulteration of maple syrup and sugar, inspection is made of manufacturing plants, stores and restaurants.

#### **Subsection 4.—Reclamation and Development**

The prime objective of the Department of Agriculture has always been the better use of land and much of the experimental and research work has been concerned with the soil. For many years the Government, through the Department of Agriculture, has provided financial assistance when problems have arisen in connection with land and water resources. Such problems have usually been too large in scope for individual, municipal or provincial undertakings but the assistance given has been essentially on the self-help plan.

The development and rehabilitation projects undertaken under the provisions of the Prairie Farm Rehabilitation Act and the Maritime Marshlands Rehabilitation Act are reviewed in detail in Section 3 of this Chapter dealing with Agricultural Irrigation.

#### **Subsection 5.—Canada's Relationship with FAO**

Conceived at a special United Nations Conference at Hot Springs, Virginia, in May, 1943, and finally brought into being at Quebec in October, 1945, the Food and Agriculture Organization of the United Nations (FAO) has as its objectives the raising of levels of nutrition and standards of living of the peoples of all countries, improvement in the efficiency of production and distribution of farm, forest and fisheries products, and the betterment of the conditions of rural populations. Beginning with 42 member nations in 1945, the membership had expanded to 65 by the end of 1949.

FAO is governed by a Conference in which each member nation has one vote. Between sessions of the Conference, which have been held annually, the Council of FAO acts for the Conference. The work of the Organization is directed by a Director-General who is appointed by the Conference. The technical divisions of FAO—Agriculture, Distribution, Economics and Statistics, Forestry and Forest Products, Nutrition, and Rural Welfare—provide a wide range of fact-finding and advisory services designed to furnish vital information as a basis for sound national and international action on the problems of food and agriculture, forestry and fisheries.

The report of the Director-General on the work of FAO during 1948-49 describes the four major activities carried on by the Organization:—

(1) FAO has served as a world extension and advisory agency applying modern scientific knowledge for increased production, improved handling and processing, and better distribution of food and other farm, forest and fisheries products. Examples of such technical aid to governments include the fight against rinderpest and other deadly live-stock diseases; the control of insects and other destroyers of growing crops and stored grains; widespread distribution of seed of improved crop plants; soil conservation planning and demonstration; surveying of irrigation and drainage needs and possibilities of opening new lands to production; planning of farm mechanization programs; training of government statisticians; and assistance in formulating national goals in production, trade and consumption and in laying out plans to achieve them.

(2) FAO has brought governments together and worked closely with other agencies in organizing international action in these fields. Examples of this work include the setting up of the new International Rice Commission to deal with urgent problems of the whole rice economy, and the new Indo-Pacific Fisheries Council to help governments increase production of food from vast areas of sea and inland waters; the organization of regional forestry commissions in Latin America and Europe to promote and integrate forest development; work with the World Health Organization on the agricultural aspects of malaria control programs and with the United Nations International Children's Emergency Fund in its child-feeding program.

(3) FAO has compiled and published information relating to the production, processing, trade, prices and consumption of agricultural, forestry and fisheries products. Examples of this work include commodity bulletins, statistical year-books for agriculture and forestry and periodical statistical reports on agriculture and fisheries.

(4) Much effort also has been devoted to appraising the outlook for production and consumption and to problems of international trade in food and agricultural commodities vital to the welfare of large numbers of producers.

At the fifth session of the Conference of FAO meeting at Washington, Nov. 21 to Dec. 6, 1949, proposals contained in the Report on World Commodity Problems were examined. This Report was prepared by a panel of economic experts appointed by the Director-General. They had addressed themselves primarily to the problem of agricultural commodity surpluses caused by the inconvertibility of currency. The Report recommended the creation of an International Commodity Clearing House, with an international fund and power to buy and sell surplus agricultural commodities on special terms.

The Conference found that it was unable to recommend the establishment of such a clearing-house, declaring that the financial functions proposed "could be performed by the governments directly involved". It was pointed out that exporting and importing countries could devise provisions relating to the financial difficulties in the particular commodity involved, within the framework of individual commodity agreements. It was generally agreed that, where they are practicable, commodity agreements provide the best method for dealing with the current or prospective surplus commodity situation.

In addition, the Conference established a Committee on Commodity Problems to be under the supervision of and responsible to the Council of FAO. This is an advisory body created to give attention primarily to the food and agricultural

surplus commodity situation arising from balance of payment difficulties. The Conference endorsed FAO's full participation in the Expanded Program of Technical Assistance for Economic Development.

It was decided to establish FAO's permanent headquarters at Rome, Italy.

Canada, as an important agricultural producer and exporter, has maintained a close interest in FAO and has played a prominent role in its development. A Canadian was a member of the original Executive Committee of the Organization and Canada has had continuous representation on the eighteen-member Council of FAO which replaced this Committee. Canadians are on most of the standing advisory technical committees and have taken part in many of the technical missions sent to under-developed countries by FAO. While Canada has been able to provide some technical assistance to other nations through FAO she has benefited materially also from the technical and statistical information supplied by FAO and through participation in discussions on national and international policies relating to agricultural production and distribution.

## Section 2.—Provincial Governments in Relation to Agriculture\*

### Subsection 1.—Agricultural Services

**Newfoundland.**—Government agricultural services in Newfoundland, since 1934, have been operated by the Agricultural Division of the Department of Natural Resources. The Division maintains an extension service and encourages agricultural development by the payment of bonuses for the purchase of pure-bred sires and for the clearing of land, assistance with agricultural exhibitions, the payment of subsidies on live stock and the conducting of a soil-survey service. Practical farm training is given to young men at the Government Demonstration Farm. Government policy relating to land settlement affecting both civilians and war veterans, and the scheme of assistance to farmers in clearing land with government-owned tractors is administered by the Land Development Division of the Department of Natural Resources.

**Prince Edward Island.**—The Department of Agriculture is presided over by a Minister, assisted by a Deputy Minister, a Dairy Inspector and assistant, a Pathologist and Veterinarian, a Soil Assistant, four County Representatives, a Superintendent of Women's Institutes and an Assistant.

**Nova Scotia.**—Provincial agricultural policies in Nova Scotia are administered by the Department of Agriculture and Marketing, with the Minister's Office and those of the Deputy Minister, the Director of Marketing Services, and the Superintendent of Agricultural Services located at Halifax. The Department is composed of several Branches, each headed by a Director. The Branches include: Agricultural Engineering Services; Animal and Poultry Services; Chemistry, Soils and Fertilizer Services; Dairy Services; Extension Services; Field Crops Services; Horticultural and Biological Services; Immigration and Land Settlement Services; and Marketing Services. With the exception of the agricultural representatives who are located in the 18 county offices, all technical officials are located at the Nova Scotia Agricultural College, Truro.

**New Brunswick.**—Provincial Government policy concerning agriculture in New Brunswick is directed by the Department of Agriculture. This Department has as its head the Minister of Agriculture who is assisted by a Deputy Minister and

\* Information supplied by the Departments of Agriculture of the various provinces

the Directors of the following Services: extension, live stock, dairy, veterinary, poultry, horticulture, field husbandry, soils and crops, plant protection and promotion, agricultural engineering, home economics, Credit Union Co-operative Association, agricultural education and apiculture.

**Quebec.**—The Department of Agriculture of Quebec comprises ten services: education, rural economics, extension, animal husbandry, horticulture, field husbandry, information and research, handicrafts and home economics, health of animals and rural engineering. Each service is divided into sections dealing with particular problems. The Department also includes many other special organizations such as the Farm Credit Bureau, the Research Council, the Rural Electrification Bureau, and the Dairy Industry Commission.

A competition has been held annually since 1890 and each year has encouraged over 100 farmers to improve their farms in order to win the honours of the Agricultural Merit Order. County Farm Improvement Contests, started about 1930, have brought about most gratifying results on over 5,000 farms and remain very popular. Each contest lasts five years during which time farms are completely transformed and their production greatly increased.

Soil-improvement policies include large drainage projects carried out by the Department and smaller projects by groups of farmers with government help. Over 500,000 acres have been reclaimed or improved in the past few years. Financial and mechanical assistance is given for land clearing, stoning, levelling and terracing. Grants are also available for underground drainage, liming, etc.

Various forms of assistance are offered towards crop and live-stock improvement. An artificial insemination station operates at St. Hyacinthe for the benefit of breeders' clubs. Plant-breeding stations are maintained at Macdonald College for cereal and forage crops and at Ste. Foy, near Quebec, for vegetables and small fruits. As regards plant and animal health, trained specialists, with main laboratories at Quebec and field laboratories in different districts or schools, are employed in the work of curbing the enemies of plants and animals.

Agricultural co-operation is widespread in Quebec. There are 645 co-operatives with 63,000 members; 90 agricultural societies (27,000 members) look after local interests and organize county exhibitions. There are also in operation 900 Cercles de Fermières (Women's Institutes) with a total membership of 50,000 and numerous junior farmer clubs.

Farm credit, established in 1936, accepts about 2,000 loans each year, two-thirds of which are used to facilitate the settlement of young farmers. Special grants are also available to farmers starting their sons on new farms.

**Ontario.**—The Ontario Department of Agriculture maintains administrative and financial assistance services to agriculture in Ontario through 12 branches: (1) the Live Stock Branch promotes live-stock improvement policies, licenses and examines stallions and gives support to pure-bred live-stock associations; (2) the Crops, Seeds and Weeds Branch assists in the development of good cultural practices, the use of improved strains of seed, the promotion of improved pastures and the eradication of weeds; (3) the Dairy Branch provides an inspection, instruction and supervision service for all creameries and cheese factories; (4) the Farm Economics Branch carries on cost studies of agricultural production in co-operation with agricultural organizations; (5) the Fruit Branch enforces fruit and vegetable regulations and provides an information service to growers; (6) the Co-operation and

Markets Branch administers the Farm Products Marketing Act and the Credit Unions Act, and supervises co-operatives under the Co-operative Marketing Loans Act; (7) the Milk Control Board, under the Milk Control Act, regulates and supervises the marketing of fluid milk; the Agricultural and Horticultural Societies Branch gives assistance to agricultural and horticultural fairs and exhibitions, ploughing matches and other competitions; (8) the Northern Ontario Branch gives assistance to farmers and settlers in northern Ontario in connection with land clearing and breaking; (9) the Agricultural Representative Branch carries on an educational and extension service through agricultural representatives located in all counties and districts and has direction over junior farmer activities; (10) the Women's Institute Branch gives leadership and direction to farm women's organized activities; (11) the Statistics and Publications Branch, in co-operation with the Dominion Bureau of Statistics, provides a crop-reporting service and gathers and disseminates data on crops, live stock and dairy products; (12) the Ontario Farm Labour Service is organized to secure and provide help for farmers during their busy seasons. The Department administers the Horticultural Experiment Station at Vineland, the Western Ontario Experimental Farm at Ridgetown and the Demonstration Farm at New Liskeard.

**Manitoba.**—The Department of Agriculture of Manitoba serves through the following branches: agricultural extension; live stock; dairy; agricultural publications and statistics; weeds administration; co-operative services; and the Provincial Veterinary Laboratory.

The Extension Service deals with agronomy, horticulture, poultry, agricultural engineering, beekeeping, junior live stock, boys' and girls' clubs and women's work, with specialists devoting their attention to these subjects. Meetings, field days and short courses are held throughout the Province. There are 28 agricultural representatives located throughout the Province, each representative serving from one to five municipalities.

The Live Stock Branch administers the Animal Husbandry Act, develops and administers policies which encourage the improvement and production of live stock, and works in close co-operation with the Veterinary Laboratory Service and the Dominion Health of Animals Division in the control of live-stock diseases.

The Dairy Branch administers the Dairy Act, supervises the grading of cream, inspects creameries and cheese factories, gives instruction in cheese- and butter-making, issues licences to makers of dairy products and to cream graders, furnishes plans and specifications in connection with the establishment of new creameries and cheese factories, etc.

The Agricultural Publications and Statistics Branch publishes and distributes, annually, approximately 100,000 bulletins, circulars, posters, leaflets, etc.

The Weeds Administration Branch directs the activities of 18 municipal weed-control units comprising 70 rural municipalities engaged in eradicating deep-rooted, persistent perennial weeds; supervises weed demonstrations; investigates weed problems; conducts weed surveys; and prepares weed literature, radio addresses, articles, pictures, mounted weed specimens, etc.

The Co-operative Services Branch takes care of the registration and supervision of co-operatives and credit unions and the administration of the Acts governing them. The Branch also gathers and compiles statistics on co-operative activity throughout the Province and supervises expenditures by the Study Group Committee and the activities of the Co-operative Promotions Board.

The Veterinary Laboratory operates a diagnostic laboratory for animal diseases, the services of which are available to veterinaries and live-stock owners.

**Saskatchewan.**—The Department of Agriculture in Saskatchewan maintains the following services: (1) Administration; Information and Radio Division, which supplies up-to-the-minute information of value to farmers; and the Statistics Branch which, in co-operation with the Dominion Bureau of Statistics, maintains a crop-reporting service and gathers data on production, marketing and income. (2) The Agricultural Representative Service is the extension branch. The Province is divided into Agricultural Conservation and Improvement Districts in which a program of agricultural improvement is carried on, featuring stability in agriculture by soil conservation and improved live stock, grain and forage production. An Agricultural Co-operative Extension program functions in this Province in collaboration with the Federal Government and the University of Saskatchewan. The Director of the Representative Service is also Director of the Farm Labour Division which, in co-operation with the Federal Department of Labour and the National Employment Service, directs the larger movements of farm labour into and out of the Province. (3) The Apiary Branch registers beekeepers, inspects apiaries and promotes better management practices. (4) The Conservation and Development Branch promotes the organization of activities to conserve or develop the soil and water resources, assists the Federal Government in the installation and administration of province-wide projects and operates irrigation and dry-land winter-feed farms, licenses water users and the sale of farm implements. (5) The Dairy Branch licenses and inspects dairy manufacturing plants and frozen-food locker plants, licenses cream graders and milk and cream testers, and promotes herd improvement through cow-testing centres and organized Herd Improvement Associations. (6) The Field Crops Branch promotes good cropping, tillage and soil conservation practices, encourages the improvement of native meadows and farm pastures, the maintenance of fodder and feed and seed grain reserves, administers emergency policies in fodder and feed grain, encourages control measures for insect and weed pests, encourages the use and distribution of good quality seed and operates a seed-cleaning plant. (7) The Lands Branch administers lands in the settled part of Saskatchewan owned by the Province which are used for agricultural or pasturage purposes, classifies Crown land according to the use for which it is suited and disposes of such land under long-term lease or reservation for inclusion in a private unit or a land-utilization project. (8) The Live Stock Branch, encourages the use of suitable animals for breeding purposes by establishment of pure-bred sire areas, gives assistance in purchase and distribution of stallions, bulls, boars and rams, examines and licenses stallions, arranges for exhibits of live stock, registers brands, bonds and licenses live-stock dealers and agents, wool-warehouse operators, wool collectors and buyers, promotes warble fly and other live-stock insect control and advises on live-stock feeding and management. (9) The Poultry Branch maintains flock-culling and turkey-grading and -banding services, administers an approved hatchery policy, licenses wholesalers and first receivers of poultry products, hatcheries and hatchery agents, bonds produce dealers and poultry buyers, and promotes flock improvement. (10) The Veterinary Branch investigates conditions with a view to safeguarding the health of live stock and poultry and co-operates with Federal Government officials and practising veterinarians in disease control.

**Alberta.**—The Department of Agriculture is divided into a number of branches, each concerned with a particular phase of the industry. (1) The Field Crops Branch deals with all matters pertaining to the utilization of the soil and production of

crops. Agricultural Service Boards have been set up on a municipal basis to carry on certain local programs in co-operation with the Department. (2) The Live Stock Branch aids in maintaining the quality of Alberta herds and flocks through policies designed to assist farmers in securing pure-bred herd sires. The live-stock industry is also given assistance by the services of an artificial insemination laboratory established at the School of Agriculture at Olds. The work of the Branch includes the inspection of stallions and the administration of Acts relating to stock inspection, brands, domestic animals, and the sale of horned cattle. (3) The Dairy Branch is responsible for the setting of standards in construction and sanitation practices, enforced through licensing and inspection of all dairy manufacturing, milk distributing and frozen-food locker plants. The Branch administers all matters pertaining to the dairy industry and provides facilities for chemical and bacteriological analyses of dairy products. (4) The Poultry Branch carries on programs to improve poultry husbandry and, through a flock-approval policy, the control of pullorum disease is being accomplished. It also maintains an up-to-date demonstration and breeding plant at Oliver. (5) The Veterinary Services Branch is responsible for the diagnosis of animal diseases in the Province. Diagnostic services are provided to the veterinarians and considerable veterinary extension work is carried on by the staff. A modern live-stock veterinary laboratory is in operation. (6) The Apiculture Branch administers the Bee Diseases Act, which requires the registration of all beekeepers and the maintenance of an inspection service. The Branch also carries on a considerable amount of general educational work. (7) The Agricultural Extension Service operates through 37 offices, in which there are located 43 District Agriculturists and 13 District Home Economists. The District Agriculturists work with farmers, assisting them with their many problems and carrying to them the various Departmental policies designed to improve the standard of agricultural practices throughout the Province. The District Home Economists provide a complementary service for farm women, aiding them in matters pertaining to foods and nutrition, sewing and clothing, home administration problems, etc.

The Alberta Junior Farm and Home Clubs educate farm young people in the practical phases of farming and home-making, and train them in the essentials of good citizenship. In 1949 there were 343 junior clubs, with a total membership of about 5,636.

The Department issues bulletins dealing with agricultural and home economics topics and assembles statistical data required by many organizations within the Province.

**British Columbia.**—The Department of Agriculture has four main divisions.

(1) The Administrative Division is responsible for the general direction of agricultural policies, administration of legislation affecting agriculture, supervision of extension programs, collection of agricultural statistics, compilation of reports and publications, preparation of material for agricultural exhibitions, supervision of farmers' and women's institutes. (2) The Animal Industry Division consists of general live-stock, veterinary, dairy, and poultry branches and supervises the promotion and improvement of animal production, fur farms, brand inspection, inspection of beef grading, control of contagious diseases of animals, eradication of insect pests detrimental to live stock, and field extension connected with animal nutritional work. (3) The Plant Industry Division includes horticulture, field crop, plant pathology, entomology and apiculture branches and supervises fruit,

vegetable and seed production and surveys dealing with orchards, small fruits, flowering bulbs and greenhouse areas; also suppression of insect pests and plant disease inspection with control of noxious weeds and general promotion of crop production. (4) The Agricultural Development and Extension Division includes field-extension work through the district agriculturist service, clearing agricultural lands for production, agricultural engineering, farm labour supply, and junior club projects. Extension Division officials of the Department are located in 32 agricultural centres throughout the Province.

### Subsection 2.—Agricultural Colleges and Schools

All provinces with the exception of Newfoundland, Prince Edward Island and New Brunswick provide facilities for training in agricultural science at university level. Such colleges are administered by either the Department of Agriculture or the Department of Education of the respective province. At the secondary school level, practical courses in agriculture are included in the high-school curricula of all provinces except Newfoundland and Prince Edward Island. The Province of Quebec provides for such instruction in special schools.

### 3.—Agricultural Colleges and Schools, by Provinces, 1950

Province	Number and Type	Course
Newfoundland.....	—	—
Prince Edward Island.....	—	—
Nova Scotia.....	1 agricultural college.....	2-year degree course and short-term or correspondence courses in vocational agriculture.
Quebec.....	3 agricultural colleges.....	4-year degree and 2-year diploma courses.
	1 school of veterinary science.....	4-year degree course.
	17 secondary agricultural schools....	2 winter terms for farm children.
	6 agricultural orphanages.....	Practical training for prospective farmers.
	4 special schools.....	Dairy, veterinary, experimental and fur-farm schools.
		Short courses and special or refresher courses are offered to farmers by most of these schools.
Ontario.....	1 agricultural college.....	4-year degree, 2-year diploma and short courses in agriculture and household science.
	1 college of veterinary science.....	4-year degree course.
	1 agricultural school.....	2-year diploma course.
Manitoba.....	Faculty of Agriculture, University of Manitoba.	Degree courses in agriculture and household science.
Saskatchewan.....	Faculty of Agriculture, University of Saskatchewan.	Degree courses in agriculture and household science.
Alberta.....	Faculty of Agriculture, University of Alberta.	Degree courses in agriculture and household science.
	3 agricultural schools (one under construction).	Vocational course in farming and home-making.
British Columbia.....	Faculty of Agriculture, University of British Columbia.	Degree course in agriculture.

## Section 3.—Agricultural Irrigation and Land Conservation

### Subsection 1.—Federal Projects\*

#### PRAIRIE FARM REHABILITATION ACT

The Prairie Farm Rehabilitation Act is a rehabilitation program conceived by Parliament in 1935 to meet the problems of drought and soil drifting adversely affecting agriculture on the Canadian prairies.

Existing agencies of the Government of Canada were assisted, with P.F.R.A. funds, to expand their activities in providing leadership in the immediate drought problems. In particular, cultural investigations were carried out by the Experimental Farms Service to insure the most economic use of the limited supply of soil moisture for crop production and the prevention of soil drifting farm lands that were a menace to surrounding good land. A program of water conservation to meet immediate needs was also initiated in 1935. Other services, such as the Economics Division, were assisted where special knowledge was required for rehabilitation measures.

An amendment to the Act in 1946 transferred the responsibility for cultural activities from P.F.R.A. to the Experimental Farms Service with headquarters at Ottawa.

The major activities of the P.F.R.A. administration, with headquarters at Regina, now include the construction, for the Government of Canada, of all projects concerned with water conservation and land utilization in the Prairie Provinces. In special cases where facilities for pre-investigational studies on important engineering problems are not available through existing government departments, P.F.R.A. provides its own facilities.

#### Water Conservation

**Small and Community Projects.**—P.F.R.A. provides engineering and financial assistance to farmers in the construction of water conservation works within drought areas of the three Prairie Provinces as a rehabilitation measure. The amount of financial assistance awarded is largely dependent upon the type and size of the project contemplated. At all times the P.F.R.A. policy, with respect to assistance provided, is to assist farmers to rehabilitate themselves. Authority to proceed with construction is first secured through the respective provincial water rights departments. Water conservation projects in this category are classified either as "individual farm projects" or as "community projects" undertaken by a group of farmers.

**Individual Farm Projects.**—During 15 years of operation P.F.R.A. has provided assistance to farmers to construct 43,042 individual farm projects in the form of dugouts and small dams, many of which are suitable for irrigation. The objective is to provide adequate water-storage facilities where water shortages exist, to assure dependable water supplies for domestic requirements, for stockwatering and for the production of live-stock feed through irrigation.

Of the 43,042 projects completed by Mar. 31, 1950, 36,130 have been designed as dugouts, 5,500 as stockwatering dams and the remaining 1,412 projects as small irrigation schemes. The construction of these projects has extended the benefits of water to all parts of the dry area. By so doing, a much larger number of farmers have been rehabilitated than would have been possible through the construction of

\* Prepared under the direction of J. G. Taggart, C.B.E., D.Sc., Deputy Minister of Agriculture, by G. J. Matte, Associate Director of Rehabilitation.

large schemes on well-defined watersheds and without the movement of settlers from their present holdings. The maintenance of valuable live-stock herds has been secured by assuring dependable water supplies on farm stockwatering projects and through the development of 67,850 acres of irrigated land on small irrigation schemes.

*Community Projects.*—The development of community projects is necessarily confined within the narrow reaches of well-defined watersheds where sufficient water resources are available. Where groups of farmers organize a Water Users' Association or the Rural Municipality provides leadership in an irrigation or water storage project, the P.F.R.A. co-operates with the local body. In such projects the usual procedure is for the Government of Canada to assume the capital cost of storage and connecting works, and the local body to assume the responsibility for the distribution of water to the land or along the watershed. The local body also undertakes maintenance and operation.

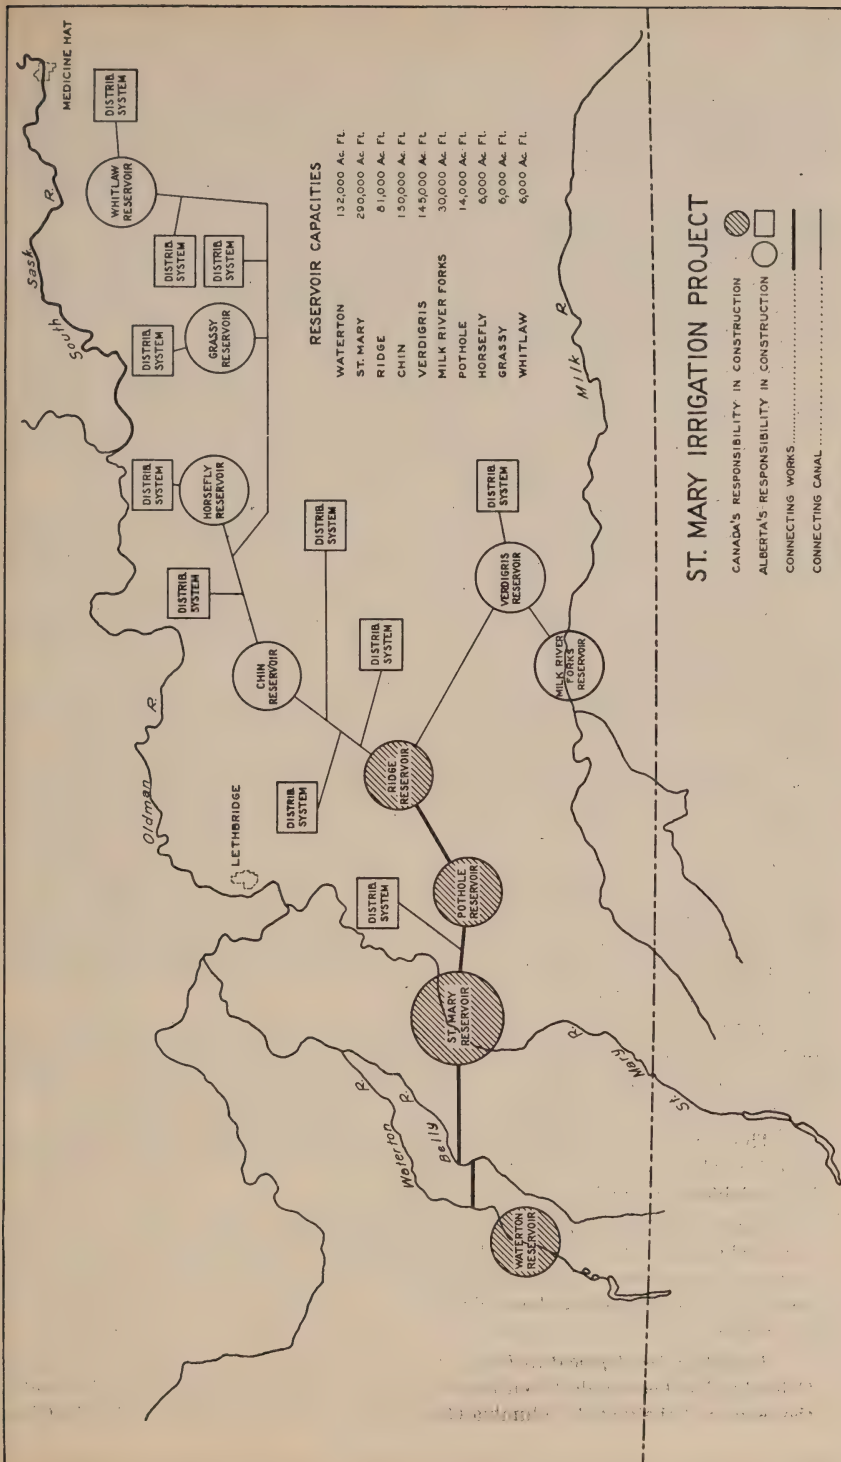

To Mar. 31, 1950, P.F.R.A. has provided the necessary assistance to construct 195 community projects. The majority of these are located on six watersheds originating in the three Prairie Provinces. Their purpose is to conserve surplus spring runoff water that flows in streams early in the season to supplement short supply later in the year. By maintaining stream flows, farmers are assured of dependable water supplies for live stock and for irrigation use. In addition, community projects provide homes for farmers moved from submarginal areas to where they can be assured a livelihood.

P.F.R.A.'s responsibility for the development of large community irrigation schemes terminates with the construction of primary reservoirs and connecting canals. In special cases where the need for early returns to farmers proved imminent, P.F.R.A. has assisted further in the development of the irrigable land and has maintained a constant surveillance of the project's operations and progress. At times, agreement has been reached between P.F.R.A. and the provincial government concerned, whereby the P.F.R.A. provides engineering and financial assistance to construct primary works and the province agrees to assist with the development of the irrigable area. Such an agreement is in effect in connection with sections of the Swift Current Irrigation Project being developed in Saskatchewan.

*Major Irrigation Projects.*—During recent years P.F.R.A. has administered special votes by Parliament for the construction of special irrigation and reclamation projects that have involved large expenditures of money. These special undertakings by the Government of Canada have extended P.F.R.A. administration beyond the boundaries of the P.F.R.A. area in the three Prairie Provinces into British Columbia.

*St. Mary Irrigation Project.*—The St. Mary Irrigation project has been undertaken by agreement between the Government of Canada and the Province of Alberta. The Federal Government has agreed to construct the main supply reservoirs and connecting works. The Province has undertaken the responsibility for construction of the auxiliary reservoirs and distributary system from the main works.

The St. Mary River System is by far the most important irrigation project ever undertaken in Canada and when completed will irrigate an area of approximately 500,000 acres. In the chart on p. 369 the federal reservoirs are shown hachured and the federal connecting works by a heavy black line: the provincial reservoirs and distributary system that tie in with these are shown by open blocks. The federal works gather water entirely from the Waterton, Belly and St. Mary Rivers.

# ST. MARY IRRIGATION PROJECT

- CANADA'S RESPONSIBILITY IN CONSTRUCTION
- ALBERTA'S RESPONSIBILITY IN CONSTRUCTION
- CONNECTING WORKS
- CONNECTING CANAL

Construction of the diversion tunnel for the St. Mary Dam was begun in 1946. This tunnel, 20 feet in diameter and 2,115 feet in length, was completed in 1947. Excavation of the irrigation tunnel for the St. Mary Dam was completed during the summer of 1949 and work on placing the lining in the tunnel was almost completed by Mar. 31, 1950. Fill operations on the dam continued during 1949. Completion of work on the main dam is expected in 1950.

Six and one-half additional miles of main canal joining the Pothole Coulee Reservoir with the St. Mary Dam were completed during the 1949 construction season. In addition, excavation work on the St. Mary spillway was begun in the autumn of 1949 and was almost completed by Mar. 31, 1950.

*Central Saskatchewan River Development.*—The Central Saskatchewan Development is a proposed irrigation project of the territory lying between the town of Elbow and the city of Saskatoon. The key structure on the project will be a dam on the South Saskatchewan River located at a point midway between the towns of Outlook and Elbow in Saskatchewan.

The plan is to stabilize agriculture in the south central area of the Province where prolonged droughts have created serious economic problems for over 50,000 farmers. Full use will be made of the river's water resources through irrigation, water control, power, urban water supply, recreation and employment.

Considerable investigational work was undertaken on the project during the year ended Mar. 31, 1950, a full report of which was presented to the Government of Canada.

*Bow River Irrigation Project.*—The Bow River Project is the undeveloped portion of the Canada Land and Irrigation Company project located west and north of Medicine Hat in Alberta. Development of this project will facilitate the irrigation of 180,000 additional acres of land in that district. The Government of Canada has authorized the purchase of the project from the Canada Land and Irrigation Company and negotiations are under way to complete the purchase and to execute the agreement. This project is being undertaken by the Government of Canada in order to rehabilitate hundreds of farmers now residing within the drought areas of southern Saskatchewan and southeastern Alberta. In addition, it is expected that this scheme will serve as a stabilizing influence on agriculture in south central Alberta.

Engineering surveys and soil mechanics investigations were commenced on this project during the 1949-50 fiscal year.

*Red Deer River Project.*—The proposed Red Deer River Development will bring under irrigation over 500,000 acres of land located in the east central part of Alberta. The project will consist of a dam on the Red Deer River at Ardley and about 100 miles of main canal to two main reservoirs—Craig Lake and Hamilton Lake.

The dam will contain power installations to produce power for pumping and also for sale commercially. An estimated 20,000,000 kwh. of water power will be available for sale when fully developed.

Engineering topographic and plain table surveys on lands proposed for irrigation were all but completed during the 1949-50 fiscal year. Engineer surveys on proposed irrigation works were also nearing a stage of completion and negotiations were under way to finalize all those phases of study pertinent to the development of the project.

*Irrigation Development in British Columbia.*—Irrigation development in British Columbia has been undertaken in connection with the Veteran's Land Act and at the request of the British Columbia Government. Two projects, namely, the Chase

Irrigation Project and the Johnstone Western Canada Ranching Project No. 1, have been completed within the South Thompson Valley area. On these projects, 755 acres of land have been developed for irrigation and homes have been provided for approximately 35 Second World War veterans.

Four other projects, located in the Okanagan and South Thompson valleys of British Columbia, were in the construction stage of development at mid-summer, 1950. They are: the South Thompson-Niskonlith Gravity Project; the Westbank Irrigation Project, the Cawston Benches Irrigation Project, and the Johnstone Western Canada Ranching Project No. 2. When completed these projects, affecting 3,460 acres, will be settled by approximately 300 veterans and used for the production of fruit, high-return-value seed and ground-crops.

Four additional projects were surveyed during 1949 and recommendations have been made for their construction in 1950-51.

**Major Reclamation Projects.**—*Riding Mountain Reclamation Project.*—Exploration and reclamation work was begun in 1948 on the northern and eastern slopes of the Riding Mountain region in Manitoba, and in 1949-50 considerable exploratory and reclamation work was conducted in this area. Flood waters flowing down from the mountains at high velocities, carry large volumes of silt, uproot trees and erode creek and river channels. This silt and debris is carried down the various streams and deposited where the stream grades become flatter and velocities of water decrease. Stream channels and drainage ditches become clogged and often, in times of flood, streams overflow their banks and inundate large areas of valuable agricultural land.

Considerable investigational work is being conducted in this area to determine corrective means of minimizing flood hazards. Engineering topographic surveys were completed during the 1949-50 fiscal year and investigation to stabilize stream channels to minimize bank erosion and silting of stream channels was initiated during the year.

Construction work was conducted during the 1949 summer season on two sections of the Riding Mountain Drainage Basin, the Edward's Creek Diversion Drain and the Mink River Drain. This work was undertaken by agreement between the Federal and Manitoba Governments, each government to contribute 50 p.c. of the cost.

*Lillooet Valley Reclamation Project.*—The Lillooet Valley Reclamation Project has been undertaken upon agreement between the Federal and British Columbia Governments and the Pemberton Valley Dyking District. This project is located in the Lillooet River Valley, B.C., above and below the town of Pemberton and its object is to protect lands now under cultivation and to reclaim additional lands by dyking and drainage.

The land in this area to be reclaimed will ultimately amount to 14,000 acres' which will allow farmers in the district to increase their holdings and also permit the settlement of hundreds of additional inhabitants.

Construction work to deepen and straighten the channel leading from Lillooet Lake to Green Lake below the town of Pemberton was completed during the 1949 construction season. In addition, the construction of dykes and drains from Miller Creek to Ryan Creek above the town of Pemberton was completed during the 1949-50 fiscal year. Survey work from Green River to Miller Creek was completed

in 1949 in anticipation of construction to begin the following year. Construction work above Ryan Creek has been held in abeyance until further experience can be gained from reclamation work already undertaken.

**Special Investigations in Connection with Irrigation Projects.**—The four principal phases of pre-investigational study in the field of engineering include: surveys (exploration), soil mechanics, drainage and hydraulics, and design. These studies are undertaken by P.F.R.A. to gather the fundamental groundwork of technical and other basic information that is required before construction of any project is undertaken. Considerable work in each of these fields of study was undertaken during the 1949-50 fiscal year, together with co-operative studies using the services of existing federal departments.

### Land Utilization

In addition to cultural and water-conservation activities, the rehabilitation of drought areas involves the conversion of large tracts of submarginal land, which had been initially cultivated, to a permanent grass cover for live-stock production and the re-location of farmers residing thereon. To this end the P.F.R.A. Land Utilization Program has constructed 81 community pastures, resulting in the reclamation of 1,502,750 acres of submarginal land. During the 1949-50 construction season, 62,910 acres of this area were enclosed with the construction of two new pastures in the Rural Municipalities of McCraney and Caledonia and several extensions to existing pastures.

During the 1949-50 fiscal year, summer grazing was provided for over 70,000 head of live stock owned by 5,500 farmers living on lands adjacent to these pastures. An extensive pasture improvement program is in effect on all pastures and is immediately initiated as new areas are enclosed. This policy has more than doubled the 1938 average carrying capacity on pasture land. The three improvement policies most extensively practised in all pastures are: (1) artificial regrassing—since 1938 approximately 150,000 acres of land in community pasture have been regrassed; (2) development of stockwatering sites—to Mar. 31, 1950, 800 stockwatering dams, dugouts and wells have been constructed in community pastures for the purpose of facilitating the more efficient utilization of grass resources; and (3) pasture management and controlled grazing—with the application of scientific principles to the proper utilization of grass resources on pasture lands, P.F.R.A. has been able to greatly increase the beneficial use of grass resources.

### PRAIRIE FARM ASSISTANCE ACT\*

The Prairie Farm Assistance Act, passed in 1939, and administered by the Federal Department of Agriculture, provides for direct money payments by the Federal Government, on an acreage basis, to farmers in areas of low crop yields in the Prairie Provinces and the Peace River District of British Columbia. The Act was designed to assist the municipalities and provinces, in years of crop failure, to meet relief expenditures which would normally be too great to be assumed by them. The Act provides that payments be made to farmers under certain conditions and terms and, in order that the Federal Government's costs may be defrayed to some extent, it is required that 1 p.c. of the purchase price of all grains (wheat, oats, barley and rye) marketed in the Prairie Provinces be paid to the Federal Government and set aside in a special fund for the purposes of the Act.

\* Contributed by the Department of Agriculture, Ottawa.

If the farmer, who may be an owner, a tenant, or a member of a co-operative farm association engaged in farming, is located in a crop-failure area, he may be awarded assistance on not more than one-half of the cultivated land or a maximum of 200 acres. The rates of payment range up to \$2.50 per acre.

From the inception of the scheme to Mar. 6, 1950, the total amount paid out under the Act was \$124,794,758. The amount collected under the 1 p.c. levy was \$45,008,887.

#### MARITIME MARSHLANDS REHABILITATION ACT

The marshlands of Prince Edward Island, Nova Scotia and New Brunswick are among the more productive soils in Canada when protected and properly cultivated. They are composed of deposits laid down by tidal waters and are, for the most part, adjacent to the Bay of Fundy.

The initial areas were reclaimed as early as 1630 and since that time about 80,000 acres have been protected by dykes and aboiteaux. These structures prevented flooding by tide water and permitted cultivation after drainage had been carried out. The original structures were made by hand labour and simple tools. Earth-moving equipment was not used until some time after 1940.

Through a variety of circumstances, i.e., loss of cattle markets, loss of hay markets and the increase in labour costs, maintenance of the protective structures was not adequately carried out and in many cases deterioration of the structures resulted. Because the marshlands, when protected, can play such an important role in the agricultural economy of the provinces concerned, the Government of Canada and the Provincial Governments of Nova Scotia and New Brunswick passed legislation permitting them to carry on a program of reclamation and rehabilitation of these lands. The federal Act, the Maritime Marshland Rehabilitation Act, was passed in 1948. Complementary provincial marshland reclamation Acts were passed by both Nova Scotia and New Brunswick in 1949. These Acts permitted agreements to be signed whereby the Government of Canada would construct or reconstruct the protective works, normally called dykes, aboiteaux and breakwaters, and also committed them to the responsibility of maintaining these works until such time as they could be turned back to the provinces. The Federal Government is responsible also for any engineering work in connection with the complete program. The provinces are responsible for the organization of the marsh areas, the fresh-water drainage and acquisition of any land required. They are responsible also for the instigation and follow-up of a suitable land-use program.

In 1949 an administrative and operational group was established in the Maritimes by the Department of Agriculture and the program of reclamation was initiated. In this program modern design and construction principles will be used for the construction of protective structures, bearing in mind the basic principles of the older methods used. It is estimated that 70,000 or 80,000 acres will, eventually, be protected from the tide, well drained and well farmed.

At Aug. 31, 1950, there were 70 areas under construction comprising about 30,000 acres, 250 of which were in Prince Edward Island. By the end of 1950, 20 of these areas will be well protected and approximately 15 others will have received works of some description placing them in a position to withstand the action of tidal water until major reconstruction can be carried out.

Investigations to determine the advisability of constructing a fairly large structure to eliminate the need for many miles of dyke and many aboiteaux will be carried out on the Annapolis River in Nova Scotia and on the Tantramar and Shepody Rivers in New Brunswick. Progress has been made in the establishment of standard structures and standard methods of modern construction.

### Subsection 2.—Provincial Projects

**Saskatchewan.\***—The Conservation and Development Branch, Provincial Department of Agriculture, was established Apr. 1, 1949. This Branch is responsible for the introduction of measures and a course of action that will promote greater stability in the expanding agricultural economy of the Province. The activities of the Department for which the Conservation and Development Branch is responsible are directed to the following: (1) the development of irrigation farming; (2) the reclamation of agricultural and pastoral lands by flood control and drainage; (3) the restoration of misused lands for grazing and winter-feed production; (4) the improvement of unoccupied land for agricultural settlement; (5) the development of under-utilized land for the uses to which it is best suited; and (6) the construction of community pastures not provided for in the agreement with the Federal Government or outside the area served by the P.F.R.A. program.

The work of the Department in the field of agricultural rehabilitation and reclamation is based on the co-ordination of the federal P.F.R.A. program and the Provincial Department of Agriculture conservation and development activity. A closely knit working arrangement is fostered with respect to the development of federal and provincial projects.

The following is a summary of the activities of the Saskatchewan Department of Agriculture in accordance with the division of responsibility covered by the working arrangement set out above.

There were nine dry-land feed and fodder projects under development on Apr. 1, 1950. These projects were located in areas of the Province where winter feed is normally in short supply and where lands have been under-utilized or, having once been settled for farming, have been abandoned because they were not suitable for arable agriculture. The area within the boundaries of the projects totalled 20,950 acres with 13,120 acres seeded or in preparation for seeding.

The Department of Agriculture is developing three irrigation feed and fodder projects located in, or close to, the winter-feed-deficient areas of the Province. The area in these projects totalled 3,455 acres and 2,255 acres had, up to June, 1950, been prepared for irrigation, seeded or were in the process of being seeded to forage crops.

During 1949 the installation of secondary distribution systems by the Provincial Department of Agriculture to service irrigation projects, for which storage and main canals had been constructed by the P.F.R.A., brought an additional 13,700 acres in Saskatchewan under ditch. During the same year, 20 Water Users Districts were established. This activity enabled 630 farmers who had designed irrigation systems to form associations for the group responsible for operating and managing irrigation schemes.

The activity in the developing and promoting of community pastures, outside the scope of the P.F.R.A. program, resulted in the construction and improvement of 12 pastures. These pastures are operated as community pastures by the Department of Agriculture, or by the municipal authorities in the municipality in which they are located, or by co-operative community pasture associations.

Activity in the development of unoccupied land for agricultural settlement brought about the partial improvement of a small number of farm units in the northeastern part of the Province. The work performed on some 26 half-section

\* Prepared under the direction of M. E. Hartnett, Deputy Minister, Department of Agriculture, Regina, Sask

units consisted of the clearing of about 40 acres on each parcel. These units are located in a district better suited to agricultural production than forestry and where tree growth was deteriorating. In the reclamation of this land for settlement, sufficient tree covering will be saved from clearing to assist in protecting each farm from erosion and wind action, and to assist in a conservation program that will enable beneficial use to be made of water resources without encouraging land misuse.

The provincial reclamation program during 1949 with respect to abandoned farm and over-grazed pasture land featured the reclamation for winter-feed production of 3,670 acres and the preparation of 476 acres to be sown in 1950. A total of 4,146 acres in dry-land projects were prepared for forage-crop production. In addition, 929 acres of abandoned farm and over-grazed pasture land were prepared for forage-crop production under irrigation. A total of 5,087 acres of abandoned farm and over-grazed pasture land was seeded down to grass for summer grazing. The Department of Agriculture also sponsored three projects in which misused lands were seeded to grass for seed production, involving 625 acres.

A few miscellaneous projects were undertaken by the Provincial Department of Agriculture. The reclamation of a half-section for woodlot production was commenced in 1949. In certain areas of northern Saskatchewan the development of stockwatering facilities is necessary to stabilize farm economy; 23 farmers in three concentrated groups outside the P.F.R.A. area were assisted in the construction of dugouts and dams for water control. Drainage activities were confined to reconnaissance surveys in northeastern Saskatchewan. Engineering examinations were advanced with a view to designing drainage systems required to reclaim extensive areas for settlement and to protect other areas from flooding. More detailed surveys are required before the drainage installations are built.

**Alberta.\***—*Surveys and Investigations of Water Resources.*—Extensive surveys have been carried out from time to time in Alberta to determine the distribution and extent of the available water supplies in the Province and their most beneficial use for irrigation, water power and other purposes. Sect. 69 of the Alberta Water Resources Act gives the Minister of the Department of Water Resources wide powers with respect to investigation of the water resources of the Province.

By agreement between the Federal and Provincial Governments, much of the work done in more recent years has been carried out by federal departments in co-operation with the Province. Stream measurement is now done by the Hydro-metric Service of the Federal Department of Resources and Development, while irrigation surveys are carried out largely by the Water Development Organization under P.F.R.A. The Water Resources Division, Federal Department of Resources and Development and the power companies operating in the Province also assist in the program.

Between 1906, when irrigation legislation was enacted, and 1931, when the water resources were transferred by the Federal Government to the Province, the Irrigation Branch of the Department of the Interior (afterwards called the Reclamation Service) carried out very extensive but preliminary irrigation and water-power surveys. In addition to locating diversion points, reservoirs on the streams and the main supply canals to the irrigable lands, topographic surveys in very great detail were made of many large tracts of dry lands to determine the irrigable parcels. Such areas include:—

\*Prepared by J. L. Reid, Secretary, Alberta Power Commission, Edmonton, Alta.

(1) All land now included in the Lethbridge Northern Project as well as large tracts in possible extensions.

(2) All tracts, some 60,000 acres, originally included in the South Macleod project between the Waterton and Oldman Rivers, some of which is now in the Macleod District.

(3) About 100,000 acres of dry lands in the Retlaw, Lomond, Enchant, River Bow and Sundial areas included in the extensions of the Canada Land and Irrigation Company project (now the Bow River project).

(4) About 50,000 acres in the Champion area, north of the Little Bow River in Townships 14 and 15, Ranges 13 and 14, West 4th Meridian.

(5) About 2,000,000 acres of land between the Red Deer, South Saskatchewan and Battle Rivers, extending from the Hanna and Youngstown Districts as far east as Saskatoon, Sask.

(6) Many other areas along the Oldman, Waterton and Belly Rivers including the United, Mountain View, Leavitt and Aetna Districts and also along Willow Creek.

Stream-flow records, topographic maps and other data prepared as a result of these surveys furnished the basic data for irrigation and water-power investigations that have been made since that time. These basic surveys, supplemented by additional investigations in detail, will in future furnish the data with which to plan the ultimate development of the water resources in the Province. Since 1935, the Water Development Organization, set up under P.F.R.A. has carried on additional surveys and investigations and co-operated in the carrying out of many projects, large and small.

The Calgary Power Company in recent years has completed a fairly extensive and detailed water-power survey of the Bow River and its tributaries. As a result the Company has constructed a number of water-power reservoirs and power stations on the stream.

By Order in Council, dated Feb. 17, 1941, the St. Mary and Milk River Water Development Committee was set up to investigate and report on the many phases of irrigation development of southern Alberta including water supplies available to Canada from the Waterton, Belly, St. Mary and Milk Rivers; the most feasible plan to put these waters to their most beneficial use; the benefits which such water development projects would confer on federal and provincial interests; the allocation of costs, methods which might be adopted to finance such developments and other phases. The Committee completed a very thorough investigation and published a full and comprehensive report, not only of the projects on the international streams, but other projects in Alberta.

*Irrigation Projects in Operation.*—Large-scale irrigation in Alberta was initiated by the Alberta Railway and Irrigation Company. The Company was an amalgamation of the Alberta Railway and Coal Company and the North West Coal Company and was organized in 1883 for the purpose of irrigating large tracts of dry lands to the south and east of Lethbridge. This land had been acquired from the Federal Government in the early days as a subsidy for constructing railways through the area. The project was the first to be authorized under the North West Irrigation Act and was initially completed in 1902 to deliver a supply of water from the St. Mary River to some 3,600 acres in the Magrath, Lethbridge, Stirling and Raymond areas. The Canadian Pacific Railway Company and the Canada Land and Irrigation Company, which were also in possession of large tracts of dry lands, subsequently initiated large irrigation projects in the Bow River drainage basin.

The history and development of the Alberta Railway and Irrigation Company, the Canadian Pacific Railway Western Section, the Eastern Irrigation District, and the Canada Land and Irrigation Company is covered in the report of the St. Mary and Milk River Water Development Committee submitted on Feb. 16, 1942, to the Minister of Mines and Resources, Ottawa.\* Since that date, the Western Section of the Canadian Pacific Railway Company has been transferred to an Irrigation District formed by the present water users in the project, and the Alberta Railway and Irrigation Company's works have been transferred to the Alberta Government. These works are essential to the further development of the St. Mary and Milk River development and will be enlarged and extended. The Leavitt and Aetna Districts, which at the time the report was made were not yet under construction, have since been completed. The following is a list of projects now in operation in Alberta, together with irrigable areas and construction costs. Certain of these developments have been brought to fruition as joint efforts by the Province of Alberta and the federal authorities under P.F.R.A.

<i>Project</i>	<i>Irrigable Area</i>	<i>Construction Cost</i>
	acres	\$
Canada Land and Irrigation Company.....	110,500	7,000,000
New West Irrigation District.....	4,500	210,000
Western Irrigation District.....	50,000	5,860,000
St. Mary and Milk River Development.....	84,000	2,134,000
Magrath Irrigation District.....	7,000	200,000
Raymond Irrigation District.....	15,100	170,000
Taber Irrigation District.....	21,500	300,000
Eastern Irrigation District.....	281,000	13,000,000
Lethbridge Northern Irrigation District.....	96,135	5,400,000
United Irrigation District.....	34,000	550,000
Highwood-Mosquito Creek Project.....	1	...

Mountain View Irrigation District.....	3,600	30,000
Leavitt Irrigation District.....	4,400	65,578
Aetna Irrigation District.....	7,300	48,705
Small private projects (approximately 700).....	70,000	700,000 <sup>2</sup>
TOTALS.....	789,035	35,688,283

<sup>1</sup> Stockwater.

<sup>2</sup> Approximate.

Since 1948, the following irrigation works have been carried on by the Provincial Government:—

(1) An Agreement was reached between the Federal and Provincial Governments in regard to the St. Mary and Milk River Development. The Province let its first contracts for main ditches in the Big Bend area in 1949 and at June 15, 1950, was awarding contracts to build the main canal of the project from Chin Lake Reservoir to Forty-Mile Coulee, a distance of some 56 miles. Contracts were also out for the lower 17 miles of the main canal between Ridge Reservoir and Chin Lake Reservoir.

(2) The Manawan Drainage ditch was constructed by the Provincial Government in the Morinville area.

(3) In 1949 the Provincial Government began work on the Heart River Diversion Project in northern Alberta. This is a multiple project which acts as a flood control and also furnishes water supply for the towns of McLennan, High Prairie, Donnelly and Felaire. At June 15, 1950, the contractor was working on the first contract of the diversion canal.

\* "Report on Further Storage and Irrigation Works Required to Utilize Fully Canada's Share of International Streams in Southern Alberta"—King's Printer, Ottawa, Price 50 cents.

**British Columbia.\***—Irrigation has been practised in British Columbia for almost a century. It began with simple structures designed to flood hay meadows or irrigate grain crops in the creek valleys. By 1900 the practicability of growing tree fruits commercially had been demonstrated and rapid development of irrigated agriculture resulted. Sizable areas of land were provided with irrigation works, subdivided into units and sold to orchardists. During the past 30 years most of the larger irrigation systems have been acquired by improvement districts and municipalities.

Three methods of irrigating are practised: periodic flooding, furrow irrigation from ditches and flumes, and sprinkling. Most irrigation is by gravity but pumping from rivers and lakes is also practised and is increasing. A total of 160,000 acres of land are irrigated in the Province of which about 40 p.c. is served by community irrigation systems and the rest by works designed for single farm units.

All varieties of tree fruits, vegetables, grain and hay that can be grown in a north temperate climate are grown on irrigated land in British Columbia. The areas of irrigated and irrigable land in the larger irrigation projects of the Province are given in Table 4.

\* Prepared by J. E. Lane, Comptroller of Water Rights, Department of Lands and Forests, Victoria, B.C.

## Section 4.—Statistics of Agriculture\*

The collection, compilation and publication of statistics relating to agriculture is a responsibility of the Dominion Bureau of Statistics. Valuable information is obtained through the Decennial Census of Canada and each Census of the Prairie Provinces. The more important data from the 1941 Census are given at pp. 250-254 of the 1946 Year Book; see pp. 390-396 of the 1948-49 edition for recent data on the Census of the Prairie Provinces of 1946. The Bureau also collects and publishes both primary and secondary statistics of agriculture including statistics of the production and distribution of agricultural commodities on an annual and monthly basis. The primary statistics relate mainly to the reporting of crop conditions, crop and live-stock estimates, values of farm lands, wages of farm labour and monthly and annual prices received by farmers for their products. The secondary statistics relate to the marketing of grain and live stock, dairying, milling and sugar industries and cold-storage holdings.

In the collection of annual and monthly statistics the Federal Department of Agriculture, the Provincial Departments of Agriculture, and such agencies as the Board of Grain Commissioners and the Canadian Wheat Board, co-operate with the Bureau. Many thousands of farmers throughout Canada also voluntarily send in reports.

The figures for 1949 contained in this Section do not include those for Newfoundland, though that Province came into Confederation on Mar. 31, 1949. Agriculture plays a relatively minor part in Newfoundland's economy. The climate is not well suited to the production of any but the hardier crops and the amount of pasture land and arable soil is limited. Statistics for that Province will be included with those for the rest of Canada as soon as comparable data are available.

## Subsection 1.—Farm Income and Capital

**Farm Cash Income.**—Estimates of farm cash income are based on reports of marketings and prices received by farmers for principal farm products and are subject to revision. The estimates include the amounts paid on account of wheat participation certificates, oats, barley and flax adjusting and equalization payments and those Federal and Provincial Government payments which farmers receive as subsidies to prices. Cash income to Canadian farmers (excluding Newfoundland) from the sale of farm products in 1949, including grain equalization and participation payments for previous years' crops, is estimated at \$2,457,000,000. The estimated

\* Revised in the Agriculture Division, Dominion Bureau of Statistics.

receipts for 1949 are slightly below the estimate of \$2,459,000,000 for 1948 but are still substantially above the 1947 cash receipts, estimated at \$1,967,000,000. Including supplementary payments received by farmers under the provisions of the Prairie Farm Assistance Act, farm cash income in 1949 totalled \$2,474,000,000 compared with \$2,480,000,000 in 1948.

The maintenance of farm cash income at the present level may be largely attributed to increased returns from the sale of wheat and live stock and the substantial grain equalization and participation payments distributed in 1949 for previous years' crops. The latter payments amounted to \$220,000,000 in 1949 compared with \$179,800,000 and \$79,100,000 in 1948 and 1947, respectively. In this connection, however, western producers of coarse grains have received only initial payments per bushel on coarse grains delivered since Aug. 1, 1949. Producer certificates issued to farmers at the time of delivery entitle them to share, at a later date, in any surpluses accumulated by the Canadian Wheat Board through the sale of the grains so delivered.

Wheat was the most important single source of cash income from marketings in 1949, accounting for 19 p.c. of the total. Cash income from this source in 1949 was considerably greater than in 1948 as a result of the 15-cent increase in price and slightly larger marketings. Including wheat participation payments on previous years' crops, wheat contributed more than one-quarter of the cash income in 1949. Increased prices for cattle and calves more than offset reductions in marketings in 1949. Receipts from this source were 3 p.c. higher than in the preceding year and constituted 17 p.c. of total cash income from the sale of farm products. Hog receipts were 8 p.c. higher in 1949 as a result of both increased marketings and prices. Reduced receipts from dairy products, poultry and eggs largely offset the gains from the sale of crops and other live stock.

#### 5.—Cash Income from the Sale of Farm Products, by Sources, 1948 and 1949

NOTE.—Figures for years prior to 1948 will be found in corresponding tables of previous editions of the Year Book.

**Farm Net Income.**—Preliminary estimates indicate farm net income in 1949 amounted to \$1,537,387,000, about 4 p.c. below the all-time high of \$1,600,336,000 established in 1948. The decline came as a result of somewhat smaller cash receipts from the sale of farm products, reduced value of income in kind, declining inventories of grain and a continued increase of farm operating expenses and depreciation charges. While year-end live-stock inventories displayed an increase for the first time since 1944, this gain was more than offset by a substantial decline in year-end, farm-held stocks of grains. Farm operating expenses and depreciation charges continued their upward climb in 1949, although at a somewhat lower rate than in the previous year. The increase in 1949 amounted to about 2 p.c. as compared with a gain of about 12 p.c. in 1948.

#### 7.—Net Income of Farm Operators from Farming Operations, 1947-49

**Value of Farm Capital.**—The items included in the term “farm capital” as used in Table 9 are: lands and buildings; implements and machinery, including motor-trucks and automobiles; and live stock, including poultry and animals on fur farms. The value of lands and buildings for intercensal years is based on the value of occupied farm lands reported annually by crop correspondents; annual values of farm implements and machinery are estimated on the basis of sales reported each year.

## 9.—Current Value of Farm Capital, by Provinces, 1947 and 1948

NOTE.—Figures for years prior to 1947 will be found in corresponding tables of previous editions of the Year Book.

<sup>1</sup> Includes trucks and automobiles.<sup>2</sup> Includes poultry and animals on fur farms.

**Value of Farm Lands.**—The estimated average value of occupied farm land in Canada for 1949 is reported at \$40 per acre. This represents an increase of 2 p.c. over the average value indicated in 1948 and an increase of 60 p.c. over the 1939 average. The total average is determined by weighting the provincial averages by the area of occupied farm land in each province according to the latest census figures available. The upward trend in farm land values from pre-war levels reflects, at least in part, the relative changes that have occurred in the price levels of farm products and of the things that farmers buy. This is illustrated by the fact that the Bureau's index of farm prices of agricultural products for 1949 was

150.5 p.c. above the 1935-39 level, while for the same year the index of prices of commodities and services used by farmers advanced 90.4 p.c. from the 1935-39 level.

### 10.—Average Values per Acre of Occupied Farm Lands, Specified Years, 1910-49

### Subsection 2.—Volume of Agricultural Production

Publication of the series formerly known as "Gross and Net Values of Agricultural Production" has been discontinued. These series contained duplications and, as a result, were not comparable with value of production estimates for other industries. A new series will eventually replace that previously published.

The Dominion Bureau of Statistics in 1949 issued, for the first time, index numbers of physical volume of agricultural production. In keeping with other Bureau indexes the base period for the construction of this index is the five-year period 1935 to 1939 inclusive. The index is constructed in such a manner that it represents a measure of "net farm production". This is achieved by removing duplication, e.g., when feed grains credited to field-crop production also appear in the various forms of live stock and live-stock products.

The high point of the index, 164.2, was reached in 1942. In 1949 it stood at 121.8 as against 125.2 in 1948.

### 11.—Index Numbers of Physical Volume of Agricultural Production, by Provinces, 1940-49

(1935-39=100)

NOTE.—For a description of this index, methods and coverage, see Dominion Bureau of Statistics "Quarterly Bulletin of Agricultural Statistics" for July-September, 1949. Figures for 1935-39 are given at p. 420 of the 1950 Year Book.

<sup>1</sup> Exclusive of Newfoundland.

## Subsection 3.—Field Crops

Total acreages of field crops in 1949 increased slightly over those of the previous year, most of the increase being in Ontario, Manitoba and Alberta. The gross farm value of all major field crops produced in 1949 on Canadian farms amounted to \$1,420,300,000, 16 p.c. lower than the 1948 record for the series which was begun 41 years ago. The 1949 value, however, held well above the pre-war average and was just fractionally below the level attained in 1946.

<sup>1</sup> Figures are exclusive of Newfoundland.

Both production and yield of all major field crops in 1949 were below 1948 levels. In the cases of barley, rye and flaxseed, acreages seeded were also lower than those of 1948.

Wheat acreage was 27,500,000 in 1949, some 15 p.c. above the 1948 level of 23,900,000 acres. Production, however, dropped from 386,000,000 bu. in 1948 to 367,000,000 bu. in 1949. The acreage of oats in 1949 was 11,400,000 acres, slightly above the 11,200,000 acres seeded in 1948, but production decreased to 317,900,000 bu. from 358,800,000 bu. in 1948. With 1949 plantings of barley at 6,000,000 acres (down nearly 1,000,000 acres from 1948) and considerably lower yields, the 1949 outturn was only 120,400,000 bu. as against 155,000,000 bu. in 1948. Due to lower requirements, rye acreage in 1949 at 1,200,000 was little more than half that of the high 1948 level and production declined from 25,300,000 bu. in 1948 to 10,000,000 bu. in 1949. The near record acreage seeded to flaxseed in 1948 fell very sharply in

1949 to just over 300,000 acres, 83 p.c. below seedings in 1948, reflecting the accumulation of substantial world stocks of flaxseed. Production dropped even more sharply from 17,700,000 bu. in 1948 to 2,300,000 in 1949, a decline of 87 p.c.

### 13.—Acreages, Yields and Prices of Principal Field Crops, 1948 and 1949, with Long-Time Averages

NOTE.—Comparative figures for Canada as a whole for earlier years are given in the corresponding tables of previous editions of the Year Book. For a record of certain figures of acreage, production and value, see Statistical Summary of the Progress of Canada at the beginning of this volume. For all crops except alfalfa the long-time average covers the years 1908-47; for alfalfa it covers 1910-47.

Crop and Year	Area	Yield per Acre	Pro-duction	Average Price <sup>1</sup>	Total Value <sup>2</sup>	Crop and Year	Area	Yield per Acre	Pro-duction	Average Price <sup>1</sup>	Total Value <sup>2</sup>

<sup>1</sup> Less than 500 ac.<sup>2</sup> Small acreages of beans were grown in Alberta during the years 1943-46. The totals for Canada include this production, but data for Alberta are not shown in the table.<sup>3</sup> Soybeans are currently grown only in Ontario but there were also small acreages in Manitoba and British Columbia in the years 1943-45. The totals include this production for Manitoba and British Columbia, but data for these provinces are not shown in the table.

**Stocks of Grain in Canada.**—Table 16 shows the stocks of Canadian grain on hand on July 31 for the years 1940-50, with averages for the five-year period 1935-39, in both Canada and the United States, also the amounts held on farms in Canada at that date. Farm stocks are given for Canada and the Prairie Provinces separately, while an additional column indicates the amounts held in country elevators in the Prairie Provinces.

**16.—Carryover of Canadian Grain as at July 31, 1940-50, with Five-Year Averages, 1935-39**

NOTE.—Figures for individual years prior to 1940 will be found in corresponding tables of previous editions of the Year Book.

<sup>1</sup> Cows in milk or in calf.

<sup>2</sup> Cows and heifers, two years old or over, kept mainly for milk.

Annual estimates, based on census data, are compiled for numbers of animals on farms. The indexes in Table 18 are the estimates of live stock for the respective years expressed as percentages of the numbers on farms during the period 1935 to 1939. Table 19 gives the estimates by provinces for 1945-49 and Table 20 the average values per head of farm live stock in the same years.

## 18.—Index Numbers of Live Stock on Farms, 1940-49

(Average 1935-39=100)

NOTE.—Comparable figures for 1906-36 are given at pp. 211-212 of the 1945 Year Book and for 1937-39 at p. 365 of the 1948-49 edition.

Year	Horses	Milk Cows	Other Cattle	All Cattle	Sheep and Lambs	Swine

1949 <sup>1</sup> .....	63.4	95.8	110.6	104.2	67.3	131.1

<sup>1</sup> Exclusive of Newfoundland.

The numbers of cattle, horses and sheep on farms showed further reduction in 1949. Estimates for that year place sheep numbers lower than any previous estimate or enumeration since Confederation. Cattle as a whole decreased 4 p.c. from 1948 and milk cows by 2 p.c. All provinces except Prince Edward Island and Nova Scotia had fewer cattle. The increase in the spring of 1949 of pigs was 20 p.c. larger than that of 1948 and as a result the number of swine on farms was 16 p.c. higher with increases in all provinces, except British Columbia.

## 19.—Live Stock on Farms, by Provinces, at June 1, 1945-49

NOTE.—Figures for years prior to 1945 will be found in the corresponding tables of previous editions of the Year Book.

<sup>1</sup> Exclusive of Newfoundland.

Under the Meat and Canned Goods Act, establishments such as abattoirs and meat-packing plants that prepare meat products for export are subject to inspection. Local wholesale butchering and such slaughterings as are carried out by retail butchers and by farmers for their own use are not included in Table 20. Actually, the slaughtering and meat-packing industry has been concentrated into a comparatively small number of large establishments to facilitate greater efficiency and utilization of products. Thus the above figures are fairly inclusive. The slaughtering and meat-packing industry is dealt with in its proper relation to all other manufacturing enterprises in Chapter XVII. On a gross value basis it normally ranks among the three largest manufacturing industries in Canada but it owes its importance to the value of raw products obtained from the farmer and rancher rather than to the value added by the manufacturing process.

<sup>1</sup> Exclusive of Newfoundland.

**Wool.**—Wool production in Canada in 1949 (not including Newfoundland) was 17·5 p.c. below that in 1948 and only 50 p.c. as much as in 1945, the peak production year. The 1935-39 average was 16,022,000 lb. and the 1949 production 9,835,000 lb. The lower shorn-wool production in 1949 was largely due to a decrease in the stock sheep population from 1,181,000 at June 1, 1948, to 1,066,000 at June 1, 1949. Average fleece weight in 1948 was 7·4 lb., compared with 7·2 lb. in 1949. The reduction in wool pulled from domestic skins amounted to about 40 p.c., and, while part of this decline was accounted for by an 18 p.c. decrease in inspected slaughterings of sheep and lambs, an increase in the special processing of skins may also have been a contributing factor.

Exports of wool in 1949 were down by about 1,000,000 lb. and imports by over 24,000,000 lb. Thus, assuming there was no change in stocks, the domestic disappearance of wool was lower by 25 p.c. in 1949 than in 1948.

Though the weighted farm price of shorn wool for Canada as a whole rose from 28·9 cents per lb. in 1948 to 29·4 cents per lb. in 1949, farm cash income from the sale of the smaller crop of shorn wool declined from \$2,141,000 in 1948 to \$1,988,000 in 1949.

### 22.—Estimated Production, Exports, Imports and Apparent Consumption of Wool, 1941-49

NOTE.—All estimates are on a 'greasy' basis. Comparable statistics of production for the years 1920-29 are given at p. 219 of the 1939 Year Book, for 1930-36 at p. 214 of the 1945 edition and for 1937-40 at p. 368 of the 1948-49 edition.

## Subsection 5.—Dairying

**Milk Production.**—Total milk production has not varied significantly since 1940, but the increase in population and in consumer-spending power has resulted in a slight change in the milk-utilization pattern. The quantity used for factory production in 1949 was 10 p.c. less than in 1944 and fluid trade requirements increased 4 p.c. The production of butter and concentrated milk products was lower in 1949 than in 1948, but the output of cheese was considerably higher.

The upward trend in prices of dairy products was reflected in a steady advance in farm values of milk production from 1939 to 1948. Though lower prices in 1949 resulted in a decrease in the gross value of milk of about 10 p.c. as compared with 1948, the 1949 figure was still more than three times the average for the period 1935-39.

### 23.—Production and Utilization of Milk, by Provinces, 1947-49, with Totals for 1944-49

NOTE.—Figures for years prior to 1947 will be found in the corresponding tables of previous editions of the Year Book. Figures for 1948 have been revised since the publication of the 1950 Year Book; those for 1949 are subject to revision.

<sup>1</sup> Includes values of skim milk, buttermilk and whey retained on farms—not included in the figures published in previous editions of the Year Book.

<sup>2</sup> Exclusive of Newfoundland.

**Butter and Cheese Production.**—During the years 1940-49, the total butter production fluctuated from a high of 369,000,000 lb. in 1941 to a low of 326,000,000 lb. in 1946. The 1949 total of 332,000,000 lb. decreased 5 p.c. from 1948.

The production of cheese reached a peak of 208,000,000 lb. in 1942, but the increased demand for other dairy products, such as butter, fluid milk and concentrated products, caused a sharp decline in 1943 and a lower level of production generally in subsequent years. A low of 95,000,000 lb. was reached in 1948. However, the decline of butter prices in 1949 was responsible for an increase of 24,000,000 lb. in cheese production for that year as compared with 1948, with the result that the Government was in a position by midsummer to complete its contract for the delivery of 50,000,000 lb. of cheese to the United Kingdom.

### 25.—Production of Butter and Cheese, by Provinces, 1947-49, with Totals for 1944-49

<sup>1</sup> Factory-made cheese includes cheddar and other cheese made from whole milk. The latter, which amounted to 2,879,000 lb. in 1947, 4,923,000 lb. in 1948 and 4,247,000 lb. in 1949, was produced in Quebec, Ontario, Manitoba, Saskatchewan and Alberta.

<sup>2</sup> Exclusive of Newfoundland.

**Production of Concentrated Milk Products.**—Products manufactured in concentrated milk plants and creameries equipped with powder manufacturing facilities are classified as whole-milk products and milk by-products. Production of whole-milk products in 1949 decreased by 11 p.c. from the high of 307,000,000 lb. in 1948, while concentrated milk by-products increased by 6 p.c. over 1948, continuing the gains made each year since 1943.

## 26.—Production of Concentrated Milk Products, 1945-49

NOTE.—Figures for years prior to 1945 will be found in corresponding tables of previous editions of the Year Book. Figures for 1948 have been revised since the publication of the 1950 Year Book; those for 1949 are subject to revision.

<sup>1</sup> Exclusive of Newfoundland.

**Domestic Disappearance of Dairy Products.**—The estimated consumption of milk and cream, on a milk basis, amounted to 4,357,000,000 pt. in 1949, an increase of 95,000,000 pt. as compared with 1948 and of 503,000,000 pt. as compared with 1942. The average daily consumption per capita was 0.91 pt. in 1949, the same as in 1948. The combined consumption of milk and cream reached a peak of 1.02 pt. in 1945 and 1946 when subsidies were in effect.

The domestic disappearance of butter in 1949 (creamery, dairy and whey) was approximately 315,338,000 lb. as compared with 370,153,000 lb. in 1948 and 336,671,000 lb. in 1943. Per capita figures for these years were 23.43 lb., 28.73 lb. and 29.25 lb., respectively.

The domestic disappearance of cheese (including other factory cheese made from whole milk and farm-made cheese) was approximately 58,740,000 lb. in 1949, an average of 4.36 lb. per capita. This was a 13 p.c. increase over the previous year when the disappearance was 51,884,000 lb. or 4.03 lb. per capita.

The domestic disappearance of concentrated whole-milk products decreased slightly, moving down to 16.43 lb. per capita in 1949 from 17.48 lb. per capita in 1948; milk by-products moved up to 5.10 lb. in 1949 from 4.37 lb. in 1948.

Domestic disappearance of all dairy products represented the equivalent of approximately 1,083 lb. of milk per capita in 1949 compared with 1,212 lb. in 1948.

### 28.—Estimated Consumption of Milk and Cream (expressed as Milk), by Provinces, 1947-49, with Totals for 1944-49

NOTE.—Figures for 1948 have been revised since the publication of the 1950 Year Book while those for 1949 are subject to revision.

<sup>1</sup> Exclusive of Newfoundland.<sup>2</sup> Includes malted milk, cream powder, and sub-standard products of a variable fat content, items which do not appear separately in this table.<sup>3</sup> Includes milk by-products items not separately listed, namely, condensed buttermilk, powdered buttermilk, sugar of milk and casein, 1944-49, powdered whey, 1948 and 1949.<sup>4</sup> Includes ice cream and cottage cheese in terms of milk.

## Subsection 6.—Poultry and Eggs

The number of poultry on farms in Canada on June 1, 1949, was almost the same as on the same date of 1948. Although hens and chickens showed a slight drop, turkeys, geese and ducks, all increased during the year. The values per head of all classes of poultry also increased, so that the total value of poultry on farms was greater than in 1948.

The average number of laying hens on farms in 1949 was lower than in 1948 and the rate of lay also decreased. As a consequence, egg production in 1949 decreased by about 12 p.c. The average price of eggs per dozen was about 1.5 cents lower in 1949 than in 1948. The lower production together with the population increase resulted in a per capita consumption of eggs amounting to 22.3 doz., 1.2 doz. less than in 1948.

Farm production of all poultry meat was up 14 p.c. over 1948; fowl and chicken meat increased almost 13 p.c. and turkey meat 21 p.c.

**30.—Numbers and Values of Poultry on Farms, by Provinces, as at June 1, 1947-49**

NOTE.—Figures for years prior to 1947 will be found in corresponding tables of previous editions of the Year Book.

<sup>2</sup> Includes hatching eggs.

<sup>3</sup> Excludes hatching eggs.

## Subsection 7.—Fruit

Fruit growing is carried on to some extent in all provinces but the industry reaches commercial proportions only in Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. In the other provinces, because of climatic conditions, tree fruits do not thrive and fruit growing is chiefly confined to berries, which can be protected artificially or by the snow during the severely cold winters. In the Prairie Provinces continuous effort is being made to develop apple varieties that will withstand the sub-zero temperatures common in that part of the country. This research has met with some success and such varieties as Dolgo, Osman, Rescue, Haralson and Heyer No. 12 have been established. Native berries play an important part in furnishing fresh fruit in areas where cultivated types are not grown. The most important of these is the blueberry which abounds in the more isolated areas of Quebec, Ontario, Nova Scotia, New Brunswick and Newfoundland. Blueberries are the second most important fruit exported from Canada, being exceeded in volume and value only by apples: the principal market is the United States. Native strawberries, raspberries and grapes are also found growing in abundance and in certain areas of the Maritime Provinces cranberries are harvested from native bogs. In the Prairie Provinces saskatoons are an important native berry.

*Pears.*—The pear is one of the oldest of cultivated fruits. The Romans grew them hundreds of years before the Christian era and they were probably known and used centuries before any records were kept. The fruit reached the highest development with Belgian and French horticulturists and it is to these workers that we owe most commercial varieties.

The pear was brought to Canada by the early French settlers who planted seeds in the Maritimes and Quebec. Very little is known of the history of the pear in Canada but it is safe to assume that it follows, generally, the course of the apple. The varieties grown now have come almost altogether from the wild pear of southern Europe and Asia (*Pyrus communis*). A few varieties, notably Keiffer, are hybrids derived from *Pyrus communis* and *Pyrus serotina*, a Japanese type.

**Subsection 8.—Special Crops**

**Tobacco.**—The chief tobacco-growing area is located in southern Ontario in the counties adjacent to Lake Erie. It is from this district that most of the cigarette tobacco comes. The most extensively grown tobacco is of the flue-cured or Bright Virginia type. In 1948 there were 85,200 acres devoted to this type. Burley tobacco is the other important type grown in Ontario, 10,706 acres of which were harvested in 1948. Dark air-cured and fire-cured tobacco as well as cigar tobacco are also grown but on a more limited scale. The only other important producing province is Quebec. In 1948 there were 5,650 acres of flue-cured tobacco, 6,463 acres of cigar tobacco and 819 acres of pipe tobacco harvested in that Province.

A study of Department of National Revenue reports of tax-paid withdrawals of tobacco products since 1920 reveals changes in the smoking habits of Canadians. In 1922, the first year for which comparable figures were available, Canadians, smoked per capita 229 cigarettes, 20 cigars and 1.26 lb. of cut tobacco and, in addition, smoked or chewed 1.14 lb. of plug tobacco and used about 1½ oz. of snuff. In the following 26 years, with a certain amount of fluctuation, per capita consumption of cigarettes increased to 1,230 per annum but cigars dropped to 16.3. Per capita consumption of cut tobacco went up to 2.01 lb., reflecting increased use of cut tobacco in "roll-your-own" cigarettes, and cut plug declined steadily. Strangely enough, the per capita use of snuff remained the same at about 1½ oz.

### 35.—Acreages, Production and Values of the Commercial Crop of Leaf Tobacco, 1944-49

NOTE.—Figures for years prior to 1944 will be found in corresponding tables of previous editions of the Year Book.

**Sugar Beets and Beetroot Sugar.**—Sugar beets are grown in Quebec, Ontario, Manitoba and Alberta and six beetroot sugar factories are located in these provinces. In Quebec, sugar beets have been grown only since 1942 and production centres around St. Hilaire, south of Montreal in the Eastern Townships. The area harvested in Quebec in 1948 was 2,900 acres although the plant at St. Hilaire has capacity to handle production from 10,000 acres. In Ontario, beetroot sugar factories are located at Wallaceburg and Chatham. The acreage in Ontario declined steadily from 38,169 in 1940 to only 9,287 in 1943. Since that year, however, the acreage has again expanded and in 1948, 18,500 acres were cropped, though production still remained well below the capacity of the two plants and only the Chatham factory processed beets in 1948. Sugar-beet production in Manitoba also declined during 1941-44. In 1940, the area harvested was 15,682 acres while in 1948 the area amounted to only 9,500 acres. The sugar-beet plant in Manitoba is located at Fort Garry. Beetroot sugar production in Alberta is carried on in the neighbourhood of Raymond and Picture Butte. This area has seen a steady increase during the last six years with the acreage in 1948 amounting to 29,200 acres.

**Apiculture.**—The 1948 honey crop was of near-record proportions. Because the increase took place in all major producing provinces, considerable difficulty was experienced in marketing the crop. Prices early in the season were at 1947 levels but when it became apparent that there was more honey than the market could readily absorb, prices dropped rapidly. Representations were made to the Canadian Government for assistance and as a result the Government undertook to purchase 5,000,000 lb. at a basic price of 14 cents per lb. f.o.b. Montreal. About 3,000,000 lb. came forward, two-thirds of which was white honey.

**Maple Sugar and Maple Syrup.**—Production of maple sugar and syrup remains at a relatively high level in Canada. The centre of the industry is in the counties south of the St. Lawrence River in Quebec where much of the sugar and syrup for export is made.

While a considerable quantity of sap is made into syrup, maple butter and “la tire” or maple taffy, much of the crop is marketed as block sugar, the blocks varying in size from 1 to 15 lb. depending on the type of mold used by the farmer. The chief market for Canadian maple syrup and sugar is the United States. During the 1949-50 season, 340,000 gal. of syrup and 7,557,000 lb. of sugar, with a total value of \$4,538,000, were exported.

Most of the maple syrup sold in Canada is marketed direct to the consumer by the producer, but a considerable amount of both sugar and syrup is sold each year to processing firms, where it is blended to produce a uniform grade of syrup.

**Fibre Flax.**—The area devoted to the growing of fibre flax was drastically reduced in 1949, reflecting the increasing difficulty growers are experiencing in marketing the crop. The United Kingdom is the chief market for Canadian flax fibre. The Canadian quota has been reduced in line with the general policy on dollar imports and this, coupled with the devaluation of the pound, has resulted in lower domestic prices. Under more favourable conditions Canadian flax would move freely to the United Kingdom as there is a demand for Canadian dew-retted flax fibre. Recently a committee was appointed by Order in Council to investigate the flax fibre industry in Canada and to study home markets for domestic fibre and the possibility of producing fabrics not in direct competition with Irish linens which are manufactured more cheaply than they can be made in Canada.

### Subsection 9.—Prices of Agricultural Produce

During 1949 the movement of the index numbers of farm prices of agricultural products was generally downward with only slight reversals of this trend taking place in June and December. In December it stood at 245.4 (1935-39=100) as compared with the all-time high of 263.8 established in August, 1948. The annual average for the year of 250.5 compares with the highest annual average of 252.4 registered in 1948.

#### 43.—Average Index Numbers of Farm Prices of Agricultural Products, by Provinces, 1939-47, and by Months, 1948 and 1949

(1935-39=100)

NOTE.—A description of this index, its coverage and the methods used will be found in the "Quarterly Bulletin of Agricultural Statistics" for October-December, 1946.

<sup>1</sup> Average cash closing price Winnipeg Grain Exchange to Sept. 27, 1943. Thereafter, initial payments plus additional payments to producers.

<sup>2</sup> Based on cash closing prices Winnipeg Grain Exchange. From Aug. 1, 1944, to Oct. 22, 1947, prices of oats and barley remained at or near the government-imposed ceiling prices. From Oct. 23, 1947, to July 31, 1949, open market trading again prevailed. Equalization payments to producers are included for the crop years 1943-44 to 1947-48, inclusive.

<sup>3</sup> During March the Canadian Wheat Board assumed control of Canadian flaxseed stocks and the price was held at \$1.64 for remainder of crop year.

<sup>4</sup> Fixed price to growers. <sup>5</sup> \$5 fixed price to growers plus 50 cents participation payment.

<sup>6</sup> Winnipeg Grain Exchange renewed trading in flaxseed cash and futures on Aug. 16, 1948. The Canadian Wheat Board was authorized to buy all flaxseed offered to it during the 1948-49 crop year on the basis of \$4 per bushel for No. 1 C.W. in store Fort William-Port Arthur.

<sup>1</sup> Classification of live stock was changed in February, 1949, as follows: steers up to 1,050 lb. changed to steers up to 1,000 lb.; steers over 1,050 lb. to steers over 1,000 lb.; lambs, good handy weights to lambs, good; sheep, good handy weights to sheep, good.

<sup>2</sup> No sales reported.

### Subsection 10.—Food Consumption

**Consumption of Major Foods.**—A study of consumption of the major foods was undertaken during the war years by the Dominion Bureau of Statistics in recognition of the national and international significance of such information. While data on total consumption of certain commodities such as wheat, alcoholic beverages, meats, etc., have been available for a considerable period, it was found necessary to establish a per capita level of consumption of a wide range of products on a comparable basis.

The figures represent available supplies including production and imports, adjusted for change of stocks, exports, marketing losses and industrial uses. All calculations have been made at the retail stage of distribution, except meats for which the figures are worked out at the wholesale stage. The amounts of food actually eaten would be somewhat lower than indicated because of losses and waste occurring after the products reached the hands of the consumer. It should also be pointed out that there are minor discrepancies in certain of the figures since statistics of storage stocks in the hands of retailers and consumers were not available. However, the figures represent the best summary of food consumption data that has been compiled for Canada.

All basic foods have been classified under 13 main commodity groups. Totals for each group have been computed using common denominators for the group, as for example: milk solids (dry weight) in the case of the dairy-products group;

fat content in the case of fats and oils; and fresh equivalent in the case of fruits. All foods have been included in their basic form, that is, as flour, fat, sugar, etc., rather than in more highly manufactured forms.

The series in Table 46 represents the official estimates of yearly supplies of food moving into consumption, expressed in pounds per capita, for the years 1935-39 as an average for comparison with the years 1948 and 1949.

<sup>1</sup> Subject to revision.

<sup>2</sup> Revised to exclude inedible molasses.

<sup>3</sup> Exclusive of Newfoundland.

<sup>4</sup> Includes farm-made cheese.

<sup>5</sup> Includes cream expressed as milk.

**Consumption of Meats.**—Production of meats from slaughter in Canada, total supply, distribution and per capita consumption of meats and lard are shown in Table 47. All estimates are on a carcass-weight basis except canned meats which are in terms of product. There was a 4 p.c. decrease in output in 1949 as compared with 1948. Lower output was reflected in sharply reduced exports of all meats except offals. On a dressed-carcass basis total exports amounted to only 206,000,000 lb. in comparison with 418,000,000 lb. in the previous year. However, per capita consumption of all meats in 1949 in terms of cold dressed-carcass weight amounted to 138.6 lb. as compared with 135.3 lb. in 1948. There was a marked increase in pork consumption while moderate decreases were shown for beef, veal, mutton and lamb.

<sup>1</sup> 1949 figures subject to revision. <sup>2</sup> Edible meat excluding offal. <sup>3</sup> Basis cold dressed carcass weight. <sup>4</sup> Includes edible offal of beef and veal. <sup>5</sup> Quantity small; included with beef. <sup>6</sup> Edible meat excluding fats and offal. <sup>7</sup> The positive changes represent deductions from the available supply during a given year and therefore are subtracted; similarly, negative changes represent an increase in disappearance. Where no changes are indicated it is assumed that stocks at the beginning and end of period were the same. <sup>8</sup> Estimated. <sup>9</sup> Includes rendered pork fat.

## Subsection 11.—Census Statistics of Agriculture

Summary statistics from the Census of 1941 dealing with agriculture are given in the 1945 and 1946 editions of the Year Book. Vol. VIII, Census of Agriculture, contains detailed information on farm population and workers, farm values and indebtedness, crops, live stock, occupied farms by size, tenure and type, farm facilities and expenditures.

Statistics showing the major changes taking place in agriculture in the Prairie Provinces for the census years between 1921-46 are given in the 1948-49 Year Book; agricultural information in detail is contained in Vol. IV, Census of the Prairie Provinces, 1946.

Agricultural statistics for Newfoundland are given in Vol. II of the Census of Newfoundland and Labrador, 1945.

## Section 5.—International Crop Statistics

Tables 48 and 49 are based on official statistics published by the Office of Foreign Agricultural Relations, United States Department of Agriculture, and give the acreages and production of wheat for the harvests of 1948 and 1949, oats, barley and corn for 1949, with averages for the years 1935-39, in the leading countries of the world.

North America led other continents as a producer of wheat in both 1948 and 1949 (if the U.S.S.R. is considered separately from Europe and Asia) with about 27 p.c. and 24 p.c., respectively, of the total world production. The United States alone produced nearly 20 p.c. of the total in 1948 and 18 p.c. in 1949. Although a large exporter of wheat, Canada produced only about 6 p.c. of the world wheat crop in each of the two years.

In 1949 the Union of Soviet Socialist Republics was the second largest wheat producing country with 18 p.c. of total world production. China, which held first place in Asia, was third in world production of wheat in the same year, with 13 p.c. of the total.

The acreage sown to wheat in 1949 showed a slight increase of 4 p.c. over that of the previous year, but total production decreased by 170,000,000 bu.

The North American Continent also led in world production of oats and corn in 1949 (the U.S.S.R. being again considered separately) with the United States producing 33 p.c. and 61 p.c., respectively, of the total. Asia was the leading continent for world barley with 31 p.c. of the total, China contributing 14 p.c. The Union of Soviet Socialist Republics also produced 14 p.c. of the total, followed closely by the United States with 11 p.c.

### CANADA'S FOREST ECONOMY†

Canada is well known as a land of lakes and rivers with extensive forests reaching from the Atlantic to the Pacific. Canadians have long looked to these forests for supplies of timber to feed their sawmills, their pulp and paper mills, and their furniture factories and boat-building works. The use of wood is almost second nature to them. Yet because Canada is so extensive that the economy of one region may differ widely from that of another, the forests and forest industries are rarely viewed as a unit in the country's economy as a whole. In this article the many parts of the economy based on the forests are brought together in order to present a comprehensive summary showing the relative value of the forests to the economic life of the country.

In Canada, the land is the basis of the economy. The wise use of the land is the foundation of good forestry. Likewise is it the foundation for sound policies for agriculture; for water conservation and water-power development; for game and fish protection; for the fur trade; for the provision of recreation areas and tourist resorts. All these values of the land are interdependent: thus good forestry will aid in maintaining agricultural lands against drought and erosion; will continuously protect water catchment areas and assure supplies of water; will furnish good cover for game and fur-bearing animals; and will give Canadians opportunities for recreation which only the forests can provide.

The strong tendency on the part of many people to evaluate Canada's forest resources in terms of timber alone is understandable. Timber is the most obvious product of forest land, and commonly the chief marketable commodity. The non-timber values of the forests, referred to above, while of great economic importance, have been relatively neglected. As a result of the increasing recognition of these values a broader concept of forestry is developing.

\* Sections of this chapter that deal with forestry and forest administration have been revised in the Forest Economics Section, Forestry Branch, Department of Resources and Development. Section 1 is based on Forestry Branch Bulletin No. 89, "A Forest Classification for Canada". Sections dealing with forest utilization and forest industries, except as otherwise noted, have been revised in the Forestry Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

† Prepared by the Forest Economics Section, under the direction of D. A. Macdonald, Director, Forestry Branch, Department of Resources and Development.

## CANADA'S POSITION AND RELATIONSHIPS IN THE WORLD PICTURE\*

Of the earth's 57,000,000 sq. miles of land surface, forests cover 27 p.c., or 30 p.c. if the Continent of Antarctica is excluded. Two-thirds of these timberlands, totalling 10,000,000 sq. miles, are considered to be productive, with almost 5,500,000 sq. miles accessible for development under present methods of woods operations.

In North America, the productive forests spread out over 2,000,000 sq. miles—almost 22 p.c. of the land area. This puts the Continent, with 19 p.c. of the world's productive forest, in third place, behind Europe (including the whole of the Union of Soviet Socialist Republics) and South America. When the forests are further classified as accessible or inaccessible, North America, with 24 p.c. of the world's accessible forests, ranks second to Europe (including the whole of the U.S.S.R.). These timberlands are located largely in Canada and the United States and extend over 1,300,000 sq. miles. Because these stands comprise one-third of the accessible coniferous and almost one-fifth of the accessible broad-leaved forests of the world, Canada and the United States are able to assume a prominent role in supplying the world's needs for wood and paper products.

Thus far, this study has brought out the relative position of the North American Continent as a whole in respect to the world and its forests. But how does Canada compare with the United States, U.S.S.R., Brazil, and other countries in forest areas? Reference to Statement I shows that the forests of the U.S.S.R.,† the largest in the world, are nearly three times greater in area than Canadian timberlands. Brazil, possessing 1,500,000 sq. miles of forested land, ranks in second place. Canada's forests rank third and the United States timber stands, covering just under 1,000,000 sq. miles, come fourth. The Belgian Congo, China, Argentina, and Australia follow the United States in that order.

\* Data upon which this material is based, are obtained from publications of the Food and Agriculture Organization of the United Nations.

† The information in Statement I concerning U.S.S.R. was published in 1933. More recent data are not available.

## I.—COMPARATIVE STATISTICS ON FOREST LAND AREAS IN CERTAIN COUNTRIES, 1948

Country	Total Land Area	Total Forest Area	Productive Forest Land			Accessible Productive Forest as Percentage of Total Land	Area of Productive Forest Land per Capita
			Access-ible	Inac-cessible	Total		
	M sq. mi.	M sq. mi.	M sq. mi.	M sq. mi.	M sq. mi.	p. c.	acres
Canada <sup>1</sup> .....	3,462	1,275	473	228	701	14	32.7
United States.....	2,977	975	659	82	741	22	3.4
Sweden.....	158	91	86	2	88	54	8.5

Australia.....	2,975	119	53	25	78	2	6.7
China.....	3,646	320	65	152	217	2	0.3
Union of Soviet Socialist Republics <sup>2</sup> .....	8,209	3,682	—	—	1,765	—	—
Japan.....	145	86	76	10	86	52	0.7

<sup>1</sup> Data given for Canada are from the 1949 National Forest Inventory compiled by the federal Forestry Branch and do not include Newfoundland.

<sup>2</sup> Estimated prior to Second World War by the International Institute of Agriculture and Professor L. Ilvesalto. Figures include Estonian, Latvian and Lithuanian Republics.

Of greater importance than total areas of forest are the areas of accessible productive forest. Excluding U.S.S.R. (for which country the necessary data are not available) the United States possesses the greatest such area, 659,000 sq. miles. Brazil and Canada follow with 589,000 and 473,000 sq. miles, respectively.

The world output of primary forest products in 1948 totalled 28,000,000,000 cubic feet. To this, North America\* contributed 13,000,000,000, Europe 7,000,000,000, and Latin America 4,000,000,000 cubic feet. United States and Canadian production amounted to 9,500,000,000 and 3,000,000,000 cubic feet, respectively, with Brazilian production at 3,300,000,000 cubic feet. Sweden, Japan, and Finland followed with less than 2,000,000,000 cubic feet each.

As these production data include fuelwood, which is a product relatively low in value, as well as such highly valued products as sawlogs, veneer logs, and pulpwood, the output of each of these items will shed some light on the value of the output of primary forest products of each country. In 1948, almost the whole of Brazil's production was confined to fuelwood, while this product in Canada and the United States made up only 24 and 17 p.c. of their total outputs. At the other end of the scale the production of sawlogs and veneer logs in Canada and the United States totalled 1,250,000,000 and 5,650,000,000 cubic feet, respectively. Japan, Finland and Sweden each produced these more valuable products in quantities totalling about 300,000,000 cubic feet. In the production of pulpwood, the United States and Canada lead the world: in 1948, output amounted to 1,500,000,000 and 1,000,000,000 cubic feet, respectively; Swedish mills followed with almost 450,000,000 feet. This brief account shows that Canadian, United States, and Scandinavian producers have concentrated on the production of high-valued primary products derived from the forests.

In 1948, the world output of sawn lumber totalled 66,000,000,000 board feet. United States and Canadian mills produced 36,000,000,000 and 6,000,000,000 board feet (64 p.c. of the total world output), respectively, and were followed by Japan, Sweden and France. In the same year, the North American production of wood-pulp made up over 70 p.c. of the world's output. It is in the manufacture of newsprint, however, that Canadian mills are outstanding. During 1948 they produced 60 p.c. of the world production of 7,800,000 tons. Newsprint made in the United States accounted for 11 p.c., and mills in the Scandinavian countries produced another 11 p.c. The Canadian forests are, at present, the world's greatest single source of newsprint.

Canada is not only a producer of forest products but is also a great exporter (see p. 436). In 1948, Canadian forest products valued at \$953,674,000 made up more than three-quarters of North American exports and one-third of world exports of wood and paper products. Sweden was next with exports of wood and wood products valued at \$563,000,000. Following in order were: Finland, the United States and Norway. These five countries accounted for 87 p.c. of the value of world export trade in forest products.

#### ANALYSIS OF CANADA'S FOREST RESOURCES

In Section 1 of this chapter on Forestry (pp. 438-441), a detailed account is given of the forest regions across Canada. Reference to the map facing p. 440 will show that the Boreal Forest Region is larger than all the other regions combined.

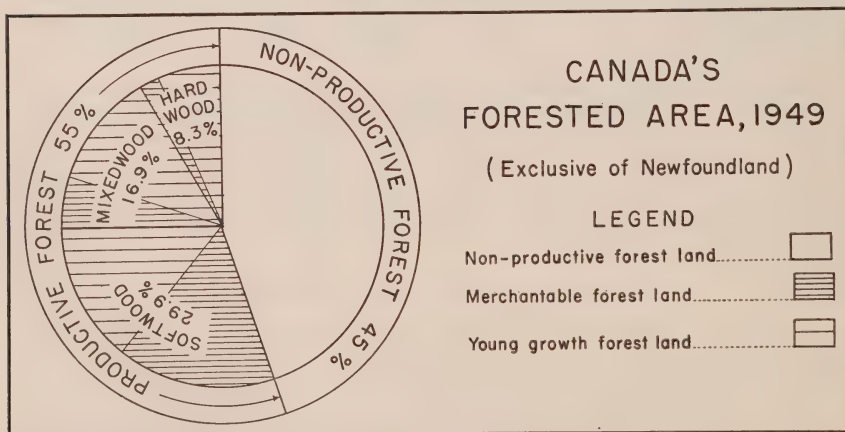

\* Mexico, Central, and South American countries are classified as "Latin America" for all data concerning production and trade in forest products in accordance with the procedure adopted by the FAO.

The distinctive and different characteristics of the forest regions affect the economies of the districts lying within their boundaries. The Boreal Region is noted for its stands of black spruce and white spruce, the backbone of the pulp and paper industry of Quebec and Ontario. The poplar and jack pine of the Region also are finding more extensive use in the manufacture of wood-pulp. Further west in Manitoba, Saskatchewan, and Alberta white spruce comprises the bulk of the lumber manufactured by the sawmills. The Coast Region is renowned for its tall timbers—Douglas fir, Sitka spruce, western cedar, and western hemlock. Douglas fir has established itself in world markets as the finest of structural timbers. This area alone provides over one-third of the lumber sawn annually in this country.

The Great Lakes-St. Lawrence Region is the source of most of the hardwood lumber sawn in Canada, particularly hard maple, yellow birch and oak. This is the area that supported the great stands of eastern white pine for which Canada was so long famous. Most of these stands have been cut out, but the Region is still the source of much Canadian white pine. In the forests of the Acadian Forest Region, spruce and balsam are of primary importance; pine and some valuable hardwood species are associated with them. This Region supports vigorous pulp and paper, and lumber industries and provides primary forest products for export.

While not of great importance commercially, the Deciduous Forest Region is the one area in Canada dominated by hardwood species alone. This Region and southern portions of the Great Lakes-St. Lawrence Region, provide small quantities of such lumber as beech, hickory, walnut and butternut.

**Productive and Non-Productive Forest Resources.**—Canada's forest resources are inventoried periodically by provincial forest authorities and with their co-operation, the Forestry Branch of the Department of Resources and Development compiles the National Forest Inventory. The latest estimates of total forest stands in the provinces, Yukon, and the Northwest Territories appear in Table 1 of this chapter, p. 442. These estimates are subject to constant revision as more accurate and complete inventories are prepared.

Almost one-half of the total forested area of Canada is classified as "non-productive", i.e., incapable of producing crops of merchantable wood. However, these forests do provide valuable protection for drainage basins and shelter for game and fur-bearing animals. The graph, "Canada's Forested Area, 1949", illustrates the ratio of the non-productive forest to the productive forest.

Of the "productive" half of the forested area, 473,000 square miles are considered to be now accessible for commercial operations. Statement II gives the total productive forested land areas by provinces and territories.

## II.—PRODUCTIVE FORESTED LANDS

Province	Total Productive Forest	Province or Territory	Total Productive Forest
	sq. miles		sq. miles
Prince Edward Island.....	610	Saskatchewan.....	46,150
Nova Scotia.....	11,555	Alberta.....	93,060
New Brunswick.....	22,000	British Columbia.....	85,892
Quebec.....	190,665	Northwest Territories and Yukon....	47,000
Ontario.....	173,800		
Manitoba.....	30,500	CANADA <sup>1</sup> .....	701,232

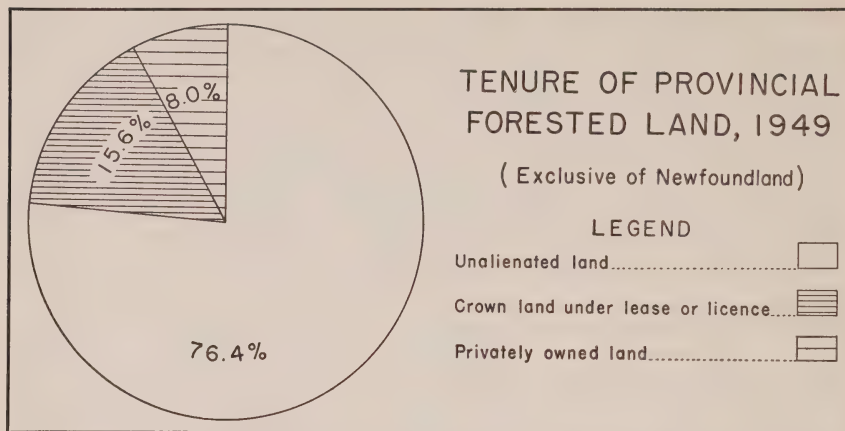

<sup>1</sup> Data for Newfoundland are not available.

The economically inaccessible productive forests (33 p.c. of the total productive forested land) contain much valuable timber suitable for lumber and pulpwood. At present it is not economical to conduct cutting operations on these areas but as low-cost methods of transportation are developed, as accessible forested areas become depleted, and as the demand for wood products increases, these inaccessible productive forests will be progressively brought into commercial development. Owing to generally less favourable climatic conditions, the productive capacity of these inaccessible timber-lands is expected to be less than that of the accessible areas now being logged.

**Tenure under which Forest Lands are Held.**—The Crown in the right of either the Federal Government or the Provincial Governments owns 93 p.c. of the total forested lands in Canada; the remaining 7 p.c. is under private ownership. The graph on p. 430 "Tenure of Provincial Forested Land, 1949" shows that 8 p.c. of the forested lands of the provinces (excluding Newfoundland) is owned by individuals or corporations. Rights to cut Crown timber under lease or licence are granted on 16 p.c. of the provincial lands, thus leaving 76 p.c. unalienated. These unalienated Crown lands are located generally in the inaccessible and least accessible areas. Statement III gives a detailed picture of the tenure of forested lands by industry and individuals, whether as private holdings or as leased or licensed lands.

Canada's farm woodlots cover more than 20,000,000 acres—10 p.c. of the total farm area. Fuelwood is the major product, although the pulp and paper industry obtains about 1,000,000 cords of pulpwood annually from woodlot owners. In addition, considerable quantities of sawlogs and other wood products are sold to sawmills and other wood-using industries. In 1948, the value of all these primary products from farm woodlots totalled \$101,600,000.

### III.—TENURE OF FORESTED LAND IN THE PROVINCES, 1949

(Source: National Forest Inventory, 1949.)

NOTE.—The 123,000 sq. miles of forested land in the Northwest Territories and Yukon are classed as unalienated Crown lands.

Province	Private Lands			Crown Lands					
	Farm Wood-lots	Corporations and Individuals	Total Private Lands	Pulp and Paper Licences	Saw Timber Licences	Permit Berths and Timber Sales	Total Alienated Crown Lands	Unalienated Crown Lands	Total Crown Lands

<sup>1</sup> Data for Newfoundland not available.

Much of the expansion of the agricultural acreage in Canada in the past has been at the expense of the forests. Since 1938 forested lands have been cleared for agricultural use to the extent of about 4,200 square miles in the Prairie Provinces, 1,500 square miles in Quebec, and 1,000 square miles in the Maritimes. Ontario and British Columbia, on the other hand, recorded during the same period a net increase in their forested lands of 700 and 1,700 square miles, respectively. In all provinces a certain amount of settled land proves unprofitable to farm and is allowed to revert to its original forest cover.

**Timber Resources and their Commercial Development.**—Estimates are given in Table 1, p. 442, of the timber resources by forest type and size class, in commercial units, for the provinces (exclusive of Newfoundland). In order to provide a more convenient comparison these data are presented for conifers only in Statement IV in equivalent volumes of merchantable cubic feet.

## IV.—TOTAL STAND OF MERCHANTABLE SOFTWOOD TIMBER, 1949

(Accessible and inaccessible in millions of cubic feet)

Province or Territory	Sawlog Material	Smaller Material	Total Volume
Prince Edward Island.....	13	48	61
Nova Scotia.....	970	1,969	2,939
New Brunswick.....	1,000	5,100	6,100
Quebec.....	10,205	72,787	82,992
Ontario.....	8,595	22,994	31,589
Manitoba.....	187	923	1,110
Saskatchewan.....	132	531	663
Alberta.....	2,546	12,134	14,680
British Columbia Coast.....	27,147	2,079	29,226
British Columbia Interior.....	17,390	43,091	60,481
Northwest Territories and Yukon.....	1,220	1,045	2,265
TOTALS, <sup>1</sup> .....	69,405	162,701	232,106

<sup>1</sup> Exclusive of Newfoundland data for which are not available.

From Statement IV it can be clearly seen that the provinces have a greater volume of softwood timber in the smaller size classes (four to nine inches diameter at breast height) than in the sawlog-size class (ten inches and over in diameter at breast height) except in the coast areas of British Columbia where sawlog material exceeds the smaller material.

It is in British Columbia's coast forests that lumbering has reached its peak in Canada and it is in the boreal forests of Ontario and Quebec that the pulp and paper industry is mainly established. This latter industry is capable of utilizing softwood species of the smaller size classes and particularly the species dominant in the boreal forests. In the Maritimes, with their large conifer stands of spruce and balsam, the pulp and paper industry outweighs the lumber industry in importance. In Alberta and Saskatchewan, lumbering is still the most important forest industry, mainly because of the lack of pulpwood markets, although there are large resources of timber of all sizes located in these provinces.

In 1948 the production of primary forest products in Canada totalled 3,198,000,000 cu. ft. The volume of logs and bolts cut amounted to 6,561,000,000 bd. ft.; pulpwood, 12,498,000 cords; and fuelwood, 9,530,000 cords. Posts, hewn ties, mining timbers, poles and piling, and like products made up the remaining output.

**Forest Depletion.**—The average annual depletion of Canada's forests for the ten years 1939-48 amounted to 3,416,000,000 cu. ft. of usable wood. Analysis of this figure is given in Table 2, p. 444, of this chapter and shows that 2,688,000,000 cu. ft. were utilized, 228,000,000 cu. ft. were burned, and 500,000,000 cu. ft. were destroyed by insect and disease attack. Applied to the total accessible productive forest, the annual rate of depletion would average only 11 cu. ft. per acre. However, as logging operations are concentrated on the most easily reached areas and not on this total area, the annual depletion on many areas being logged might easily be at an excessive rate.

In Section 6, pp. 454-463, a full account is given of the utilization by industry of products from the forests. Forest-fire losses in 1948 and 1949 are given in Table 4, p. 450.

The average annual loss of merchantable timber attributable to forest fires during the ten-year period 1939-48 amounted to 228,000,000 cu. ft., with a stumpage value of \$2,092,000 (see Statement V). An average of 5,288 fires annually burned about 2,900 sq. miles. These figures give a valuable but incomplete account of the gravity of fire losses. The devastation and impoverishment of forest soils, the damage to water run-off control, and to recreational, tourist, and wildlife values cannot be appraised reliably in terms of dollars although they are of great economic significance. The forced closing of mills whose raw materials have been destroyed results in additional loss. Repeated fires through a given area frequently create a permanent wasteland.

V.—AVERAGE ANNUAL VOLUME OF MERCHANTABLE TIMBER BURNED,  
TEN-YEAR PERIOD, 1939-48

Province	Sawlog Material	Smaller Material	Stumpage Value
	M ft. b.m.	Cords	\$
Prince Edward Island.....	—	—	—
Nova Scotia.....	2,798	609	20,368
New Brunswick.....	936	60,976	174,731
Quebec.....	—	416,049	624,073
Ontario.....	93,134	397,784	561,316
Manitoba.....	3,864	207,165	90,263
Saskatchewan.....	10,119	77,924	51,857
Alberta.....	125,235	524,725	340,172
British Columbia.....	165,212	—	201,454
Other Federal Government lands <sup>1</sup> .....	9,173	41,826	27,790
CANADA <sup>2</sup> .....	410,471	1,727,058	2,092,024

<sup>1</sup> Includes National Parks, Indian lands, Forest Experiment Stations, etc.  
the Northwest Territories and Newfoundland.

<sup>2</sup> Excludes Yukon.

Satisfactory estimates of losses caused by insects or disease are almost impossible to make. This is due largely to the enormous area of Canadian forests and the consequently high cost of assessing these losses. Complicating the problem of preparing suitable records of damage are the beneficial effects following the removal by insects and disease of decadent old trees, so that such trees may be replaced by young vigorous saplings. The annual depletion of the forests by disease and insects is tentatively estimated to-day at 500,000,000 cu. ft. of merchantable timber.

There are at present no means of appraising the losses resulting from such climatic factors as wind, ice, snow and sleet.

Finally, further losses have resulted from the lack of planned forest management. Cutting has been carried out without any other thought than the liquidation of merchantable supplies with the result that the land has sometimes been left in a condition which favoured the spread of fire, attack by insects, and erosion by wind and water. In many instances areas have failed to restock satisfactorily, nearby stands of timber have been exposed to damage by wind, wild life values have been impaired, and the areas have remained an economic loss for decades.

**Productive Capacity of the Forests.**—These data on depletion of forest products give rise to the following pertinent questions. Are Canada's forest resources capable of supplying indefinitely the amount of wood at present being utilized by her forest industries? Can the forests provide more wood than this, thereby allowing the forest industries to be expanded? These are fundamental economic questions and upon the answers to them depend, in large measure, the policies

which the Provincial and Federal Governments and private industries should adopt in regard to the forests. If, for example, the supply of wood being grown is not sufficient to maintain the forest industries, then it is vitally important that more efficient systems of forest protection and forest management be put into practice. The adoption of such measures would then assist in providing a continuous and increased flow of primary wood products to these industries.

It is clear that the approach to a discussion of the adequacy of Canada's forest resources to support industry must be on a regional or district level. Only by building up knowledge of the relation of growth and depletion in the forests, district by district, will it be possible to grasp the Canadian situation as a whole. It means little to the pulp and paper industry of Quebec, for example, to know that in Canada as a whole there exists enough pulpwood to supply the present Canadian pulp and paper industry with all its wood requirements. Or again, the stands of timber in northern British Columbia are of little significance to the lumbermen on Vancouver Island who must depend on local supplies. What a mill owner requires is the assurance of an adequate supply of timber within the shortest possible distance from his mill.

On a regional basis, it is known that some areas will not be able to maintain indefinitely the industries presently dependent upon them; others can support only the present level of industrial capacity, while certain areas, presently distant from both mills and markets, could sustain a large measure of industrial development but must await the economic conditions suitable for their exploitation. For many areas no definite answers whatever can yet be given. From information now available it seems evident that Canada is potentially capable of supporting far larger forest industries than at present; but it is equally certain that any substantial expansion of industry without the introduction of forest management on a much wider basis would be detrimental to our forest economy.

The primary step is a stock-taking of our forest resources. In a country of Canada's vastness such a task cannot be accomplished quickly or cheaply. Not only is it necessary to know the quantity of timber available, but also the individual species by age classes, and their composition by forest types. This information is a basic requirement for the most efficient and scientific development of industrial forestry in Canada.

To develop a national inventory an intricate mosaic of district stock-taking surveys must be correlated, so that the management plans for each district will fit into the national pattern.

It is not the purpose of this article to discuss the technical and silvicultural ramifications involved, but it must be emphasized that inventories are but one feature in the management of forests as a crop. Just as so much effort has been devoted to agricultural research, in order that the products of the farm might be improved, so must studies of tree growth, forest regeneration, and other silvicultural problems be intensified in order that Canada's forests may be managed for the maximum output of the most useful products. To complete these studies for the numerous forest districts in Canada will require years of research. In the meantime, however, such research is being concentrated on those areas which at present give promise of yielding the greatest returns.

Since the end of the Second World War several provinces have made great progress in bringing their forest inventories up to date. The information obtained is being used by the forest authorities to formulate their respective provincial forest policies.

Hand in hand with the formation of provincial forest policies goes the task of preparing forest management plans. Provincial officials, in co-operation with the forest industries, are taking steps that have as their object the management of the forests for a sustained yield of forest products. Another important feature in the development of these policies is the reforestation of those areas which have not regenerated naturally. Since the War, this has been given considerable attention. Improved logging methods which will ensure better natural regeneration are also being introduced where conditions are more favourable.

The relationship between the yield from the forests and the development of forest industries is affected by technological changes and scientific advances in industry. All such improvements tend to increase the degree of utilization of forest products. By devising methods to utilize the inferior tree species, for example, the forest industries can increase their wood supplies although the productive capacity of the forests has not increased. Similarly, advanced methods of extraction which will utilize a greater proportion of the whole tree will augment the available supply of wood as though additional forests were planted. Forest products research is also reducing the waste from present wood-manufacturing processes. An illustration of this is the production of industrial alcohol from sulphite liquor—a by-product in the manufacture of sulphite wood-pulp.

Adequate forest management is still in its infancy in Canada. Nevertheless, the economic obstacles to the practice of sustained yield are becoming of less importance as the available supply of timber becomes less accessible to the mills. If action is taken in an aggressive manner to conserve the forests and increase their yield, Canadian forest industries should be able to maintain, if not expand, their present capacity. The lumber industry, which was founded on virgin forests, does present a special problem. The large logs sawn into lumber in the past are being replaced by smaller sawlogs grown in second-growth stands. This does not mean, however, a smaller lumber industry but rather planning to produce clear sawlog material by the practice of good silviculture. Further, it means promoting the more economical use of wood by devising improved methods of lumber manufacture, and by developing new techniques in the use of lumber in construction.

From the standpoint of the national economy the primary needs are: to grow the greatest amount of the most suitable woods as economically as possible; to improve standards of wood utilization; and to reduce to a minimum the forest losses from fire, insects and disease.

#### INDUSTRIES BASED ON THE FOREST\*

Across Canada, these industries which include operations in the woods, the lumbering industry, the pulp and paper industry, the wood-using industries, and the paper-using industries, present an intricate mosaic. From all provinces such products as lumber, pulp and paper, railway ties, telephone poles, furniture, and plywood enter into the stream of Canadian commerce. Participating in the historic growth of the country, these industries have made a distinctive contribution to the nation's economic development and cultural heritage.

Canada has been, and still is, largely a producer of primary products but the country's manufacturing facilities, stimulated during the First World War and accelerated during the Second World War, have shown tremendous growth. In this development, the forest industries will continue to hold a prominent place.

In order to establish the relative significance of one industry to another or to a group of industries, the net value of production\* for each may be compared. The net value of production for "operations in the woods" amounted to \$461,000,000 in 1948, more than 11 p.c. of the net value of all primary production.

When the four forest industries—lumber, pulp and paper, wood-using, and paper-using—are grouped, their net value of production in 1948, \$916,000,000, amounted to almost 18 p.c. of the net value of all secondary production in Canada. (See Table 1, pp. 337-338.)

When the net value of operations in the woods is added to the net value of these four forest industries, the net value of all forest production totalled \$1,377,000,000, almost 15 p.c. of the total net value of all production.

Another index of the importance of an industry is the employment that it provides. During 1948, employment in the forest industries reached a peak. By giving work to over 350,000 men and women, these industries employed more than 7 p.c. of the total civilian labour force. In salaries and wages, the forest industries paid out just under \$762,569,000 in that year.

A detailed account of the output of the forest industries in 1948 will be found in Section 6 of this Chapter.

Several Canadian enterprises not classed as forest industries are dependent upon forest products for many of their raw materials. The hardwood distillation industry, while not large, relies directly upon hardwood for its raw material. Wood pulp is used extensively in the manufacture of rayon, celanese, cellophane, and a wide range of plastics. Sporting goods manufacturers, and various other industries, making goods ranging from mops and brooms to automobiles, use wood to a greater

\* Gross production less value of raw materials, fuel, etc., used in the production process.

or lesser degree. It is clear that if wood were difficult or expensive to obtain, many products taken for granted to-day would disappear from the markets, or would become much more costly through the use of higher priced substitute materials in their manufacture.

Canada's transportation services rely in no small measure upon the volume of business derived from the forest industries. The tonnage of unmanufactured forest products alone not including products of the wood-using industries, accounted for more than 17 p.c. of the total tonnage moved by the railway companies in 1948.

#### FOREIGN TRADE AND DOMESTIC UTILIZATION OF PRODUCTION

The history of the development of Canada's natural resources and of the expansion of her industries shows clearly how essential a high level of export trade is for the maintenance of her economic welfare. Statistics for the forests and forest industries bear out this statement fully. The early lumber industry was founded on the shipment of squared timber and, later, pine and spruce deals to Great Britain, and lumber to the United States. The pulp and paper industry sells 75 p.c. of its paper production in foreign markets.

Canada's favourable balance on commodity trading account is of very great significance in affording a means of settling her debit accounts abroad. In building up this commodity trading surplus the net balance of trade in wood products is of outstanding importance. Credits acquired from the sale of forest products are not only large but have been maintained for many years. In 16 of the years since 1929 forest products have provided larger contributions to the country's favourable trade balance than any other commodity group. In 1948 the net balance for wood, wood products, and paper amounted to \$880,000,000. Three-quarters of the exports went to the United States, and earned large credit items in United States dollars. These are of particular importance to-day, as they enable Canada to pay for many United States products which are essential to a high standard of living.

The commodity group "Wood, Wood Products, and Paper" leads all others in the total value of exports. Lumber, wood-pulp, and newsprint are the most important forest products which this country exports. In 1948, the favourable balance from trade in these totalled over \$785,000,000. Other forest products important as exports are pulpwood, shingles, and plywoods and veneers.

While Canada exports large quantities of forest products the Canadian market also absorbs a considerable portion of the output of the forest industries. On an average, around 90 p.c. of all the primary forest products are manufactured in Canada and the percentage has been rising in recent years. Sawlogs, pulpwood, and fuelwood account for over 95 p.c. of primary production; exports of sawlogs and fuelwood only amount to around 1 p.c. and exports of pulpwood to less than 20 p.c. of production.

Lumber marketed in Canada usually runs to a little more than half the saw-mills production. About three-quarters of the wood pulp manufactured in Canada is used by Canadian paper mills. Exports are largely made up of the chemical pulps. More than 90 p.c. of the groundwood pulp output is used in manufacturing in Canada. Canada is famous as a producer of newsprint, yet, being a country with a small population, it can use only from 5 to 10 p.c. of its output. The domestic

market for such products as wrapping, book, and writing papers has been expanding in the past decade: in these products the Canadian market absorbs the major part of the output.

#### DEVELOPMENTS IN CANADIAN FOREST POLICY

The basic importance of Canada's forest resources to all sections of the national economy makes it a matter of prime importance to maintain these resources in their most vigorous and productive state. As the major portion of Canada's timber-lands is still the property of the Crown, it is to the Provincial and Federal Governments that Canadians must look for leadership in the development of proper management practices for the forests.

Except for Yukon and the Northwest Territories and certain federal lands in the provinces, the Crown lands in Canada are owned by the provinces and administered by the Provincial Governments. With the exception of Prince Edward Island, each province maintains its own Forest Service for the administration and protection of its forest resources.

In Section 5, pp. 445-454, are given detailed accounts of the administration of Canada's forest lands. Developments in fire protection and forest research are described, along with recent advances in provincial forest management programs.

While the administration and development of the forests are largely provincial responsibilities, the Federal Government performs functions in forestry which are of real importance in the national interest. These are almost entirely confined to research and experimentation, and providing information and leadership to the provinces and industry.

The passing of the Canada Forestry Act in December, 1949, provided a legislative basis for increased participation by the Federal Government in the forestry field. In general, the national administration can now enter into agreements with the Provincial Governments, or with corporations or individuals, to develop and conserve Canada's forest resources. More specifically, the Act gives the Federal Government the power to establish National Forests or Forest Experimental Areas on lands belonging to it, and also to establish and maintain laboratories for the better utilization of forest products. A most important clause gives the Federal Government power to "enter into agreements with any province for the protection, development or utilization of forest resources, including protection from fire, insects, and diseases, forest inventories, silvicultural research, watershed protection, reforestation, forestry publicity and education, construction of roads and improvement of growing conditions and management of forests for continuous production". It is expected that agreements will be arrived at with the provinces under this clause and that some share of the costs will be borne by the Federal Government.

In the past, the emphasis in Canada has been on exploitation. In order to conserve the forests, the emphasis to-day is on management supported by forest and forest-products research. The Canada Forestry Act is a milestone along this road of endeavour.

The establishment of Canada's forest industry on a permanent basis, with an assured supply of forest products, will enable the nation to retain the eminent position it now holds in international trade which is based on forest industries. By continuing to meet the needs of the peoples in other lands for lumber, paper and other wood products Canadian forests will continue to make their contribution to human welfare.

## Section 1.—Forest Regions

The forests of Canada cover a vast region in the north temperate climatic zone, reaching from the Atlantic Ocean to the Pacific; they extend northward from the International Boundary to beyond the Arctic Circle. Wide variations in climatic, physiographic and soil conditions cause marked differences in the character of the forests in different parts of the country, hence more or less well-defined forest regions may be recognized. The following principal regions are described separately: Acadian, Great Lakes-St. Lawrence, Deciduous, Boreal, Sub-Alpine, Columbia, Montane and Coast. For descriptive purposes, it is convenient to consider two sections of the Boreal Region as separate entities: these are described hereunder as the Northern Transition and the Aspen Grove Sections.

**The Acadian Forest Region.**—This Region includes, tentatively, all the Island of Newfoundland except a portion of the Northern Peninsula (where the forest is coniferous in character, with balsam fir the characteristically dominant conifer), Prince Edward Island, Nova Scotia and all but the northwest corner of New Brunswick. The climate of the Region is characteristic of maritime regions, and is highly favourable to tree growth. Annual precipitation averages about 40 inches. Topography and geology are widely varied. In northern New Brunswick the maximum altitude is 2,700 feet above sea-level, and northern Cape Breton Island and parts of Nova Scotia are fairly rough. The surface of the remainder of the Region varies from level to gently rolling.

There is a general coniferous character to the Region, especially in the northern parts of New Brunswick and Cape Breton Island. Mixed forests, interspersed with so-called 'hardwood ridges', are common, however, occurring more frequently in the southern parts of New Brunswick and Nova Scotia.

Among the coniferous species red spruce is the characteristic dominant and is usually associated with balsam fir. White and black spruce, and white and red pine, are widely distributed. Jack pine occurs in pure stands on sandy plains. Hemlock, which is still to be found in most parts of the Region, is believed to have been much more important in former times. Other characteristic conifers are cedar and tamarack.

Yellow birch, maple and beech occur in fairly large quantities and usually occupy well-drained ridges. White birch, wire birch and poplar are found in association with the coniferous species. Among the other hardwoods are oak, butternut, basswood, ash and elm.

**The Great Lakes-St. Lawrence Forest Region.**—This Region, centring on the Great Lakes system, and extending eastward down the St. Lawrence Valley, is of an irregular character. It occupies a middle position between predominantly coniferous forests to the north and deciduous forests to the south. Precipitation varies from an annual average of 25 inches in the west to 45 inches in the east, and the growing season is from 100 to 150 days. Good forest soils of sedimentary origin are common, but southward extensions of the granitic areas of the Canadian Shield are within the boundaries of the Region.

The characteristic species are white pine, red pine and hemlock, associated with the maples, yellow birch and, in some sections, beech and basswood. Aspen, cedar and jack pine are widely distributed, and spruce and balsam fir are common in certain localities. Among the less widely distributed hardwood species are white birch, elm, hickories, white and black ash, bur, red and white oak, ironwood and

butternut. The pine forests of the Ottawa Valley and Algonquin Park have been famous as one of the greatest of Canada's lumbering areas. Elsewhere in the Region forests of mixed type predominate, with a considerable proportion of pure hardwood stands in the more favoured locations towards the south.

**The Deciduous Forest Region.**—This Region in Canada consists of a small northerly intrusion from the great forest of the same type in the United States, and occupies the southwestern portion of what is commonly referred to as the Ontario Peninsula. It enjoys very favourable climatic and soil conditions that permit of the growth of a number of tree species not found elsewhere in Canada. The area is completely settled because of its fertile soil, and the forests are represented now only by woodlots, parks, and small wooded areas on the lighter soils.

The characteristic trees of this Region are beech and sugar maple, together with basswood, red maple and several oaks. Coniferous species are represented largely by scattered specimens of white pine, hemlock and red juniper.

Among the less common hardwoods, which occur singly or in small groups, are hickories, black walnut, chestnut, tulip tree, magnolia, mulberry, sycamore, sassafras, black gum, Kentucky coffee tree and a number of other species that find their northern limit in this Region.

**The Boreal Forest Region.**—This Region covers the greater part of the land area of Canada. It stretches unbrokenly from the Northern Peninsula of Newfoundland and the Atlantic Coast of Quebec westward to Alaska. Along its southern side it follows the limits of the Great Lakes-St. Lawrence Region, then skirts the open grasslands of the Prairie Provinces, and is terminated in the west in the foothills of the Rocky Mountains. To the north it is bounded by the limits of tree growth.

The principal trees of the Region are white and black spruce, balsam fir, poplars, white birch and jack pine. Near the foothills of the Rocky Mountains the latter species is replaced by lodgepole pine. In Quebec and Ontario, and as far west as a line running from Lake Winnipeg to Lake Athabaska in the Prairie Provinces, the Region is, for the most part, underlain by granitic rocks of the Precambrian formations, known as the Canadian Shield. Within this area there are extensive tracts of good soil, formed from glacial or sedimentary deposits, but a larger portion of the Region is characterized by shallow soils. Considerable areas of bare rock testify to the disastrous results of forest fires followed by erosion. The forests of this part of the Region are mainly coniferous, with black spruce and balsam fir as dominants, and are valuable chiefly for pulpwood. West of Lake Winnipeg the same tree species are in evidence but in different proportions. Here the soil is deep and relatively fertile, and the characteristic forest is a mixture of poplar and white spruce.

The climate of the Region is severe and precipitation ordinarily varies from 15 to 30 inches annually, although these amounts are exceeded in eastern Quebec.

**The Northern Transition Section.**—This area is a part of the Boreal Region, but is described separately because its forests are of no commercial value, although some have considerable local economic value, since they provide cover for fur-bearing animals, wood for fuel and buildings for the scattered inhabitants of the Region. This Section represents a transition from the merchantable forests of the south to the treeless wastes of the Far North. White and black spruce, larch and birch are the principal tree species, and these are usually of stunted growth because of the severity of the climate. In river valleys and other protected sites occasional clumps of trees of fair size are to be found.

*The Aspen Grove Section.*—This Section lies entirely within the Prairie Provinces and is a part of the Boreal Region, but has very special characteristics. It is a zone of transition between the true forest region to the north and the open grasslands to the south. Aspen is the dominant tree and is in sole possession of most of the area. In southern Manitoba stands of bur oak are found, and elm, basswood and ash occur singly or in small groups in river beds. Most of the area is farmed and much of the forest is in the form of woodlots.

**The Sub-Alpine Forest Region.**—This Region is essentially a coniferous forest extending from the grasslands of the prairies and the western border of the Boreal Region up the eastern slopes of the Rockies to timber-line. This same type of forest reappears in a narrow strip extending northwesterly from the International Boundary between the plateaux of the Montane Region and the non-forested tundra formation of the mountain tops of the Coast Ranges.

In general, this forest formation occupies areas from 3,500 to 6,000 feet above sea-level. Rainfall is moderate, temperatures are low, and the growing season is short. The topography is mountainous with steep-sided valleys, and the soils are mostly derived from glacial and other residual material. The dominant tree species are Englemann spruce, alpine fir and lodgepole pine. Less widely distributed are mountain hemlock, alpine larch and white-barked pine.

**The Columbia Forest Region.**—This Region, often referred to as the Interior Wet Belt of British Columbia, supports forests that are somewhat similar in composition to those of the Coast Region.

The forests properly attributable to the Columbia Region comprise stands in the valleys of the Columbia and other rivers that lie between elevations of 2,500 feet and 4,000 feet above sea-level. Below this range occurs the Montane Region, and above it the Sub-Alpine. The climate is intermediate between those of the Coast and Montane Regions. The precipitation varies from 30 to 60 inches. The Region actually should be mapped as a series of 'islands' and 'stringers' surrounded by patches of sub-alpine forest; but it is impracticable to do this on so small a scale as is used for the map facing this page.

Some authorities consider the Columbia Region to be merely an extension of the Coast Forest Region. The division followed here has been adopted because of the complete physical separation of the two Regions in Canada, and also because of important differences in environmental conditions.

The principal species in this Region are Englemann spruce, western red cedar, western hemlock and Douglas fir. Among other species of considerable importance are alpine and grand firs, western white pine and western larch. Lodgepole pine commonly replaces stands destroyed by fire. Black cottonwood is found on rich alluvial soils.

**The Montane Forest Region.**—This Region forms part of what is often termed the Interior Dry Belt of British Columbia. It covers an extensive series of plateaux, valleys and ranges in the interior of the Province and extends northward from the International Boundary to the valley of the Skeena River. The

## SOUTH OF LATITUDE 75°

climate is relatively dry, with low summer rainfall and moderate to high temperatures. The driest conditions are found in the lower river valleys: here the forest gives way to open grassland.

The principal tree species are ponderosa pine, Douglas fir, lodgepole pine and aspen. Towards the northern half of the Region ponderosa pine disappears and associations of Douglas fir and lodgepole pine become dominant. Towards the north and east, stands of Englemann spruce and alpine fir grade into the forests of the Sub-Alpine and Columbia Regions. Aspen is an important constituent of the northern parts of this forest.

**The Coast Forest Region.**—This Region includes the western slope of the Coast and Cascade Mountains and the insular system, the higher elevations of which form Vancouver Island, the Queen Charlotte group and other islands along the coast. The climate is mild and equable, with heavy precipitation varying from 40 to 200 inches per annum, about 70 p.c. of which falls during the autumn and winter months. These conditions are conducive to the luxurious growth of coniferous forests and produce the largest trees and the heaviest stands in Canada.

The dominant trees are western hemlock and western red cedar. Associated with these are Douglas fir in the south and Sitka spruce in the north. All four of these species, of which the most important commercially is Douglas fir, grow to large sizes and occasionally are found in stands running up to 100,000 ft. b.m. per acre. Other conifers that occur in the Region but are of much less importance include: yellow cedar, mountain hemlock, amabilis, grand and alpine firs, and western white pine. Of the broad-leaved trees, several alders are widely distributed, and Garry oak and madrona are found in the United States in the vicinity of the Straits of Georgia. Broad-leaved maple and vine maple occur at low elevations in the southern sections, and black cottonwood, which is perhaps the most important hardwood from a commercial point of view, is found on alluvial soils in the valleys.

## Section 2.—Native Tree Species

There are more than 150 tree species in Canada, of which 31 are conifers, commonly called 'softwoods'. About two-thirds of these softwoods are of commercial importance. Of the large number of deciduous or 'hardwood' species, about 10 p.c. is of great commercial value to the wood-using industry. About 77 p.c. of the volume of merchantable timber is made up of softwood species.

A short description of the individual tree species is given at pp. 384-387 of the 1947 Year Book. More detailed information on Canadian trees is given in Forestry Branch Bulletin 61, "Native Trees of Canada"\*, published by the Department of Resources and Development.

## Section 3.—Forest Resources

The forested area of Canada (exclusive of Newfoundland) is estimated at 1,274,840 sq. miles, or 37 p.c. of the total land area. In comparison, only 16 p.c. of the land area is considered to be of present or potential value for agriculture, and 7 p.c. is classed as "improved and pasture".

<sup>1</sup> Cubic volumes do not include wood in stumps and unusable tops.<sup>2</sup> Exclusive of Newfoundland.<sup>3</sup> Including estimates of inaccessible stands in the Northwest Territories and Yukon.

The forested area of Canada, exclusive of Newfoundland (for which detailed figures are not available) is 1,274,840 sq. miles, or 37 p.c. of the land area. About 574,000 sq. miles of the existing forests are classed as 'unproductive'. These unproductive forests are made up of small trees that cannot be expected to reach merchantable size because they are growing on poorly drained lands, or at high altitudes, or are subject to other adverse site conditions. They perform valuable functions, however, by helping to protect watersheds and conserve water supplies; they provide fuel and building materials to natives and travellers in remote areas, and are the habitat of valuable fur-bearing and game animals.

The productive forests, covering approximately 700,000 sq. miles, are considered capable of producing continuous crops of timber suitable for domestic and industrial purposes. A considerable proportion of these forests is not yet accessible for commercial operations, but constitutes a valuable reserve for the future. About 473,000 sq. miles of productive forests are considered to be economically accessible at the present time. Two-fifths of the productive forest area bears trees large enough for use as sawlogs, pulpwood or fuelwood, and the remainder is occupied by young growth of various ages, kinds and degrees of stocking.

The total stand of timber of merchantable size is estimated to be 302,458,000,000 cu. ft., of which 189,051,000,000 cu. ft. is accessible. These cubic volumes are volumes of wood that can actually be used. Expressed in commercial terms, the accessible timber is made up of 242,072,000,000 bd. ft. of logs in trees large enough to produce sawlogs and 1,686,834,000 cords of smaller material suitable for pulpwood, fuelwood, posts, mining timbers, etc.

**Resources of the Province of Newfoundland.**—The entrance of Newfoundland into Confederation on Mar. 31, 1949, resulted in an appreciable increase in Canada's forested area. It is estimated that 16,000 sq. miles of the Island of Newfoundland are covered with forests. Approximately 76 p.c. is privately owned or held under long-term leases. For Labrador, an area of about 112,000 sq. miles, no estimate of the forest areas is as yet available. Some of the forests of this part of the Province have been leased, but the greater part are still controlled by the Province.

The forests have become an important source of income to Newfoundland in the past fifty years. In 1948 pulp production totalled 467,691 tons and the newsprint output amounted to 382,248 tons, of which 98 p.c. was exported. Lumbering is carried on in 1,400 sawmills, many of which are small and seasonal in operation. In 1947 their production totalled 68,000,000 bd. ft.

The Province of Newfoundland, like the other provinces, administers its own resources. The Federal Forestry Branch, on the invitation of the Newfoundland Provincial Government, has delegated officers to advise on matters pertaining to the protection and development of the forests. This involves an up-to-date inventory of the forest resources, the protection of the forests from fire, and the organization of a program of economic and silvicultural research aiming towards an adequate and continuous supply of forest products.

## Section 4.—Forest Depletion and Increment

The purpose of this Section is to present a general account of forest depletion and increment. Details of the scientific control of those influences that account for wastage, viz., forest fires and insect pests, are dealt with in the Section on Forest Administration at p. 453.

**Depletion.**—The average annual rate of depletion of reserves of merchantable timber during the ten years 1939-48, by cause, is given in Table 2. Of the total depletion, 78.7 p.c. was utilized and 21.3 p.c. was destroyed by fire, insects, and disease. The utilization of 2,687,973,000 cu. ft. comprised 39 p.c. as logs and bolts, 30 p.c. as pulpwood, 27 p.c. as fuelwood, and the remaining 4 p.c. as miscellaneous products. Approximately 7 p.c. of the wood utilized was exported in unmanufactured form.

The more efficient utilization of timber that has been cut is one factor related to forest depletion. There is little doubt that in the past too high a percentage of the sawn logs has been discarded. Changes of great significance are taking place in the uses of wood that permit of the utilization of sizes and qualities unmerchantable as sawn lumber. The development of the manufacture of rayon, cellophane and numerous other products in the cellulose industry is rapidly extending the use of wood. Plastic-wood products, fibre board and laminated wood will undoubtedly

provide an increasing demand for the so-called inferior classes of wood so that more complete utilization of the forest resources through the elimination of much of the waste that now occurs can be expected. (See also pp. 432-438 "Productive Capacity of the Forests".

## 2.—Average Annual Forest Depletion during the Period 1939-48

Item	Usable Wood	Percentages of—	
		Utilization or Wastage	Depletion
	M cu. ft.		
<b>Products Utilized—</b>			
Logs and Bolts—			
Domestic use.....	1,021,316	38.0	29.9
Export.....	26,399	1.0	0.8
Pulpwood—			
Domestic use.....	662,292	24.6	19.4
Export.....	151,324	5.6	4.4
Fuelwood.....	725,768	27.0	21.2

Poles, posts, rails.....	35,659	1.3	1.0
Miscellaneous products.....	35,773	1.3	1.1
<b>Annual Utilization.....</b>	<b>2,687,973</b>	<b>100.0</b>	<b>78.7</b>
<b>Wastage—</b>			
By forest fires.....	228,266	31.3	6.7
By insects and disease.....	500,000	68.7	14.6
<b>Annual Wastage.....</b>	<b>728,266</b>	<b>100.0</b>	<b>21.3</b>
<b>Annual Depletion.....</b>	<b>3,416,239</b>	<b>...</b>	<b>100.0</b>

**Increment.**—Practically all the depletion or drain on the forests is concentrated in the 473,000 sq. miles of productive forest classed as accessible. Replacement of normal depletion by this area alone requires an average annual growth rate of about 11 cu. ft. per acre. Complete estimates of the rates at which the forests of Canada grow are not yet available. The vast size of the country, the diversity of growing conditions, and the complex character of the forests themselves, place great difficulties in the way of estimating growth. The results of numerous studies made by the Forestry Branch indicate, beyond reasonable doubt, that over considerable tracts annual growth exceeds 25, 30 or even 40 cu. ft. per acre per annum; however, there are other areas classed as productive on which the growth is much less.

Natural reproduction of forest tree species in Canada is fortunately good except in a few localities. After an area has been cut over or burned, young growth usually appears within a short time. Thus, the re-establishment of some sort of forest growth is a less difficult problem than it is in many other countries. There is, however, no guarantee that the species reproduced will be of the kinds desired by industry. Most of the wood used in Canada is softwood and, while in general, softwood reproduction is fairly satisfactory, there are considerable areas in which a combination of cutting and fire have resulted, either in the permanent destruction of the forest or in the replacement of valuable stands by inferior types.

Many stands of 'second growth' that have come up after cutting or fire are now reaching merchantable size and are beginning to attract attention. Anticipating the need for practical guidance in the management of these accessible young forests, the Forestry Branch has a number of experiments in progress at the various Forest

Experiment Stations to improve the quality and growth of the young stands that have been established by nature. Operators, too, are showing more interest in their young stands from which future cuts of sawlogs or pulpwood must come if operations are to be on a self-sustaining basis.

There is no room for doubt that the introduction of better methods of forest management, including the provision of more adequate forest protection, can make the forests of Canada more productive than they have ever been. It is true that very large trees, which have required over 300 years to attain their present size, are disappearing and will not be replaced; but, although the forest industries of the future must use smaller logs than have been available in the past, good forest management can assure adequate supplies for considerable expansion of industry.

The potential capacity of many forest soils to produce more usable wood in a given period than they have done in the past is being demonstrated on such areas as the Petawawa Forest Experiment Station at Chalk River, Ont., and on some of the better-managed farm woodlots.

## Section 5.—Forest Administration

### Subsection 1.—Administration of Federal and Provincial Timber-Lands

The major proportion of the forest resources of Canada are owned and administered by the provinces. The Federal Government is responsible for the administration of those of Yukon, the Northwest Territories and other federal lands such as National Parks and Forest Experiment Stations. About 93,000 sq. miles are privately owned by individuals or corporations.

The Federal Government's chief responsibility in the field of forestry is to carry out research in problems affecting Canada's forests and their development, conservation and more effective utilization. Under the Canada Forestry Act, 1949, the Federal Government may enter into agreements with Provincial Governments, corporations and individuals to develop and conserve Canada's forest resources. Such agreements with the provinces may cover protection from fire, insects, and diseases, forest inventories, silvicultural research, watershed protection, and other forestry activities, and it is expected that some share of the costs involved in such developments will be borne by the national administration.

With the exception of relatively small areas owned by the Federal Government, the Crown lands and the timber on them are administered by each province in which they lie. Provincial lands suitable for growing trees are set aside for timber production, and the policy of disposing of the title to lands fit only for the production of timber has been virtually abandoned in every province of Canada. Efforts are being made, especially in Quebec and Ontario, to encourage the establishment and maintenance of forests on a community basis. More detailed information regarding forest administration in each of the provinces, except Newfoundland, is given at pp. 234-236 of the 1942 Year Book.

The general policy of the Federal Government and the Provincial Governments has been to dispose of the timber under their jurisdiction by means of licences to cut, rather than by the outright sale of timber land. Under this system the Crown retains ownership of the land and control of the cutting operations. Revenue is received in the form of Crown dues or stumpage (either in lump sums or in payments made as the timber is cut); ground rents and fire protection taxes are collected annually. All these charges against the timber and land may be adjusted at the discretion of the governments concerned.

The Atlantic Provinces\* did not adopt this policy to the same extent as did the rest of Canada. In Prince Edward Island practically all the forested land has been alienated and is in small holdings, chiefly farmers' woodlots. In Nova Scotia 73 p.c. of the forested land is privately owned; holdings exceeding 1,000 acres make up more than one-half of this area. In New Brunswick nearly 50 p.c. is under private ownership. The percentages of privately owned forested land in the other provinces are as follows: Quebec, 8 p.c.; Ontario, 6 p.c.; Manitoba, 7 p.c.; Saskatchewan, 9 p.c.; Alberta, 7 p.c.; and British Columbia, 4 p.c.

About 1,200 professionally trained foresters are employed in Canada by the Federal Government, by provincial forest services, or by pulp, paper, and lumber companies. Those working for the Federal Government are almost entirely engaged in research; those employed by the Provincial Governments devote their attention mainly to the administration of provincial forest lands; while those in private industry, although they do some research, are concerned chiefly with forest operations of their companies.

### 3.—Forest Reserves in Canada, by Provinces, 1950

NOTE.—Areas of National and Provincial Parks (which are also forest reserves) are not included in this table, but will be found at p. 29.

Province	Federal Forest Experimental Areas	Provincial Forest Reserves	Total
	sq. miles	sq. miles	sq. miles
Newfoundland.....	—	93.40	93.40
Prince Edward Island.....	—	—	—
Nova Scotia.....	—	—	—
New Brunswick.....	35.16	271.00	306.16
Quebec.....	7.25	5,612.00	5,619.25
Ontario.....	97.10	19,526.00	19,623.10
Manitoba.....	25.25 <sup>1</sup>	4,598.46	4,598.46
Saskatchewan.....	—	141,037.00 <sup>2</sup>	141,037.00
Alberta.....	62.60	8,585.54	8,648.14
British Columbia.....	—	37,912.05	37,912.05
<b>Totals.....</b>	<b>202.11</b>	<b>217,635.45</b>	<b>217,837.56</b>

<sup>1</sup> Under National Park reservation and therefore not included in total. <sup>2</sup> In Saskatchewan, the Northern Forest, established in 1950 with an area of 136,869.73 sq. miles, is comprised of all unalienated lands in the northern part of the Province and includes a number of provincial forests formerly listed separately.

**Recent Advances in Forest Management Programs.**—During recent years an increasing interest has been shown by governments and industry alike in programs to stimulate production of forest products and, at the same time, perpetuate Canada's forest resources. The Ontario Forest Management Act requires timber operators on Crown lands to submit forest inventories of their cutting areas, and to prepare management plans covering operations for a stated period of time.

Saskatchewan has demonstrated the necessity for conservation of its forest resources by curtailing the annual cut to an amount approximating 5 p.c. of the estimated stand of merchantable spruce saw-timber in each particular district.

In British Columbia the granting of forest-management licences under authority of an amendment in 1947 to the British Columbia Forest Act will, undoubtedly, lead to a great improvement in forestry practice in that Province. Continuity of tenure, which is essential to the successful operation of a sustained-yield program,

\*Exclusive of Newfoundland.

is assured by these licences by which the Minister of Lands and Forests of British Columbia may enter into long-term timber agreements. A further amendment to the British Columbia Forest Act in 1948 established a Forest Development Fund of \$2,500,000 for the building of forest roads and bridges, intended for the economical harvesting of forest products. One company in British Columbia has recognized the need for long-term planning by the establishment of an experimental demonstration forest to study the problems involved in thinning, selective cutting and reforestation in stands of immature timber.

The Provinces of Nova Scotia, New Brunswick and Ontario have each appointed an Advisory Committee composed of representatives of the Provincial Government, the forest industries and other organizations interested in the welfare of the forests, so that all forest problems might be discussed and a concerted effort made to solve them for the benefit of all.

Another aspect of forest management that is receiving active attention is the collection of more accurate inventory records of forest resources. The Department of Lands and Forests of Ontario has made great strides in its five-year plan of forest inventory covering a strip of country which comprises about 125,000 sq. miles of the forested lands of the Province. The plan includes the taking of air photographs with the particular purpose of building up inventory records, the preparation of a basic map, and finally the production of forest inventory maps from air photographs supported by field sampling.

The use of air photographs for forestry purposes is a comparatively new field in which progress has been made both in research and practice (see p. 452). By the use of such photographs the Forestry Branch of the Federal Government has been continuing its work on the aerial forest mapping of federally administered lands and other territories of direct concern to Canada. Mention may be made, for example, of the forest inventory maps which are being prepared from air photographs of the Eastern Rockies Forest Conservation Area. Data are being collected on the ground to support the interpretation of the photographs and the development of instrumental aids is being continued.

**Royal Commissions on Forestry.**—The Provinces of British Columbia, Saskatchewan and Ontario appointed Royal Commissions to study all phases of the forestry situation in their respective provinces in 1944, 1945 and 1946. The recommendations of these Commissions are described briefly at pp. 410-411 of the 1948-49 Year Book.

Although Royal Commissions have not been considered necessary in the other provinces, forestry problems are receiving close attention from governments and from industry, and steps are being taken to improve and strengthen administrative and protective services.

**Timber Control.**—The formal control of timber by the Timber Controller, as established during the war years, ceased on Mar. 31, 1950. Since that date the only controls have been those exercised through licences for the export of logs and pulpwood, required under the authority of the Export and Import Permits Act. An outline of the controls applied to meet the dislocations in the lumber industry during the war years is given at pp. 277-280 of the 1946 Year Book.

**Forestry and FAO.**—Canada has undertaken to co-operate in the forestry work of the Food and Agriculture Organization of the United Nations. The First Preparatory Conference on World Pulp Problems was held at Montreal, April, 1949,

on the joint invitation of FAO and the Government of Canada. This Conference made available much valuable information concerning world production and supplies of pulp and underlined the importance of improving statistical reports and reporting in this field. Details of the functions of FAO as they concern forestry are outlined at pp. 264-265 of the 1946 Year Book.

### **Subsection 2.—Forest-Fire Protection**

The Federal Government is responsible for fire-protection measures in the forests under its administration—chiefly those of Yukon and the Northwest Territories, the National Parks, Indian lands, and Forest Experiment Stations. Each of the Provincial Governments, except that of Prince Edward Island, maintains a fire-protection organization co-operating with owners and licensees for the protection of all timbered areas, the cost being distributed or covered by special taxes on timber-lands.

In each province, with the exception just mentioned, provincial legislation regulates the use of fire for clearing and other legitimate purposes, and provides for close seasons during dangerous periods. An interesting development in this connection in the Province of Quebec is the organization of a number of co-operative protective associations among lessees of timber limits. These associations have their own staffs, which co-operate with those of the Board of Transport Commissioners and the Provincial Government. The latter contributes money grants and also pays for the protection of vacant Crown lands lying within the area of the associations' activities. In the Province of Newfoundland, responsibility for the protection of most licensed timber-lands is vested in the lessees. In addition, the Newfoundland Forest Protection Association, maintained jointly by the government and industry, carries out certain important fire-control functions.

In the matter of forest-fire protection along railway lines, the provincial services are assisted by the Railway Act administered by the Board of Transport Commissioners. This Act gives to that body wide powers relating to fire protection along railway lines under its jurisdiction. Certain officers of the various forest authorities are appointed ex-officio officers of the Board of Transport Commissioners and co-operate with the fire-ranger staffs which the railway companies are required to employ under the Railway Act.

Under the Canada Forestry Act the federal authorities have entered into discussions with provincial forest authorities concerning co-operative measures which can be implemented for the better protection of the forests from fire. The Federal Government may assist the provinces in meeting the heavy costs which adequate protection services entail.

In many districts in Canada, radio-equipped aircraft are used to good effect for the detection and suppression of forest fires. Where lakes are numerous, seaplanes or flying boats can be used for detection, and for the transportation of fire-fighters and their equipment to fires in remote areas. In Western Canada, equipment and supplies are sometimes dropped by parachute to isolated fire crews; in one province parachutists are now employed to fight fires which are difficult of access by other means.

In the more settled areas with better transportation facilities, fire detection is carried out by means of lookout towers fitted with telephone or radio for reporting fires. Field staffs and equipment are maintained at strategic points ready to deal with fires when they are reported. These staffs, when not engaged on fire-control duties, are employed on the construction and maintenance of roads, trails, telephone lines, fire guards and other necessary improvements.

Portable gasoline pumps, which usually weigh between 60 and 100 lb. each, and linen hose are important equipment. These pumps can be carried to a fire by canoe, motor-boat, automobile, aircraft, pack-saddle or back-pack and can provide hose pressures up to 200 lb. per square inch, depending upon the elevation above and distance from the water supply. Hose lines over a mile in length are frequently used. Small hand-pumps supplied by 5-gallon portable containers are also used effectively in many cases. Tractors equipped with bulldozers or ploughs are commonly used for fire-line construction. In some regions, trucks fitted with water tanks and power pumps are employed for the control of fires adjacent to roads.

The various governmental forest authorities conduct forest conservation publicity work independently and in co-operation with the Canadian Forestry Association. Since its beginning in 1900, that Association has played an important part in securing popular co-operation in reducing the fire hazard. By means of its magazine, which has a large circulation, by railway lecture cars and motor-trucks provided with motion-picture equipment, and by co-operation with radio broadcasting stations and the press, the Association reaches a large proportion of the population of Canada. Special efforts are made through the schools, by specially appointed junior forest wardens and other means, to educate the younger generation as to the value of forests, the devastation caused by fire and the means of preventing such destruction.

**Forest Fire Statistics.**—The total number of fires in Canada (including Newfoundland) in 1949, 7,046, was the highest on record since 1922. The total area burned was 40 p.c. above the previous ten-year average. Fire-fighting costs were also the highest on record. Periods of high hazard were recorded in the spring in Newfoundland and the Maritime Provinces with the remainder of the season remaining normal. More favourable than average conditions obtained in Quebec following the critical hazards which developed in May and July. Ontario had somewhat drier weather than normal, especially in the southern parts of the Province's protected areas. A period of serious spring hazard was followed by about average summer and autumn conditions in Manitoba and Saskatchewan. However, Alberta experienced in 1949 the worst fire season of any province, especially in April and May when the bulk of the damage occurred. Dry weather persisted throughout the rest of the summer and autumn in most parts of the Province. Average conditions prevailed throughout the year in British Columbia, the Northwest Territories and Yukon.

More detailed statistics of forest-fire losses may be obtained from the Forestry Branch, Department of Resources and Development, Ottawa.

#### 4.—Summary Statistics of Forest-Fire Losses within the Provinces<sup>1</sup>, 1948 and 1949, with Ten-Year Averages, 1939-48

### Subsection 3.—Research in Forestry

The planned management of the forests of Canada in order to ensure a sustained yield of forest products is the aspect of forestry receiving the greatest attention in this country to-day. Threatened by diminishing resources, foresters in government, industry and private employ are directing their efforts towards bringing the forests under working plans where sound forestry principles can be practiced.

Forest research is an essential feature of the approach to forest management and one in which the Federal and Provincial Governments and industry are all interested. The principal agency for such activity is the Forestry Branch of the Federal Department of Resources and Development. The Provincial Governments and the forest industries carry on research in forestry to a limited extent.

Research in silviculture, forest management, fire protection and forest air-survey methods are carried out by the Forest Research Division of the Forestry Branch at Ottawa and at five Forest Experimental Areas in New Brunswick, Quebec, Ontario, Manitoba and Alberta, totalling 227 sq. miles in area. Supplementary studies are conducted in other areas in co-operation with the Provincial Governments and with industry.

Research in silviculture is concerned with the study of the forests as a dynamic community. One of the most important problems is concerned with devising methods of regenerating forest areas which do not produce satisfactorily following cutting, fire or other disturbances. Natural means are used whenever possible, but if they prove unsuccessful, artificial methods are employed. Studies of growth and succession in the more important forest types are made and attention given to the development of a satisfactory basis for classifying forest stands and sites for the effective assessment of their growth and productivity. Research in tree breeding is also carried on by selection and development of superior strains for artificial propagation.

Research on forest management is essentially empirical. Its objective is to devise methods of applying to forest areas the knowledge of silviculture, regulation of cut, protection, and forest economics that is presently available in order to maintain these areas at their most productive level.

The objectives of the forest-fire protection research of the Forestry Branch are: the improvement of methods of measuring fire danger and the adaptation of these methods to the various forest regions of Canada; the development of simple apparatus for direct readings of forest-fire danger; the study of weather inversions in mountainous country and their effect on forest inflammability; the development of standards of adequate forest-fire protection, and fire-control planning techniques; and the continued investigation and improvement of equipment for fire detection, communication and fire suppression. The Forestry Branch has developed methods for the daily measurement of the prevailing degree of forest-fire danger. The system has been successfully used by the Forest Experiment Stations and National Parks, and is being increasingly employed by the provincial forest protective agencies. Research has been undertaken in co-operation with several of the provincial forest services in order to adapt the system for local climatic and forest fuel conditions. The principal field work in this study is now being carried out in Manitoba and Newfoundland.

Canada has pioneered in the use of aerial photographs for forestry purposes and many of the techniques now in general use were developed in this country. Research in forest air-survey methods by the Forestry Branch is proceeding along the following lines: the development of improved methods of interpreting forestry information from aerial photographs and of checking their accuracy by detailed information collected on the ground; the construction of photogrammetric and other scientific apparatus required in the interpretation of photographs or in the measurement of tree images; and the development of methods and techniques for aerial photographs which will provide the details required for forest interpretations at the lowest cost. Aerial photographs taken to scales suitable for mapping purposes covering upwards of

2,600,000 sq. miles are now available in the National Air Photographic Library of the Department of Mines and Technical Surveys and about 145,000 sq. miles of forest have been mapped and classified from the photographs by the Forestry Branch.

**Forest Products Research.**—There are two Forest Products Laboratories in which research is conducted, one at Ottawa, Ont., and the other at Vancouver, B.C. The purpose of this research is to supply the basic and practical knowledge required for the best possible utilization of Canada's forest resources. Such research includes studies of the factors affecting the quality of wood and of manufactured wood products; the factors causing wood waste in logging and manufacturing; the mechanical, physical, and chemical properties of wood and their relation to adaptability in use; the treatment of wood and its use in the manufacture of fibre products, alcohol, turpentine, etc.; new and more valuable uses for woods; and the application of laboratory findings to the standardization of lumber grades and the improvement of timber specifications in the building codes of Canadian cities. As the nature of the problems requires, the Forest Products Laboratories co-operate with similar organizations in other countries, with the provinces and with industry.

The Pulp and Paper Research Institute of Canada at Montreal, Que., a corporation supported by the Federal Government, the Canadian Pulp and Paper Association and McGill University, carries out research in the field of pulps and papers. The program of work includes studies of the structure and properties of wood and bark and their chemical components; the improvement of pulping processes; studies for the improved utilization of waste products; and the improvement in the design of industrial equipment.

More detailed information on forest-products research may be found at pp. 994-995 of the 1940 Year Book.

**Forest Entomology.**—The study of forest insect problems in Canada is entrusted to the Forest Insect Investigations Unit of the Division of Entomology, Science Service, Department of Agriculture. Eight main laboratories are maintained and in addition four sub-laboratories and a number of permanent and temporary field stations and camps.

At pp. 389-400 of the 1947 Year Book a special article dealing with "Noxious Forest Insects and Their Control" appears.

**The Forest Insects Control Board.**—The Forest Insects Control Board operates under the Department of Resources and Development and is composed of nine members representing the Federal and Provincial Governments and the pulp and paper industry. Its purpose is to advise the Minister of Resources and Development as to the methods for controlling and destroying insects injurious to the forests of Canada and the means to be taken for the prevention of loss and damage from the attacks of such insects.

**Forest Pathology.**—In Canada investigations in forest pathology are carried on by the Federal Government in the Division of Botany and Plant Pathology, Science Service, Department of Agriculture. In addition to the staff at Ottawa, field laboratories are maintained at Fredericton, N.B., Toronto, Ont., Saskatoon, Sask., and Victoria, B.C. The Province of Quebec also maintains its own forest pathology service.

A detailed account of the activities in forest pathology in Canada may be found at pp. 416-417 of the 1948-49 Year Book.

## Section 6.—Forest Utilization

Forest utilization is concerned with the broad group of industries that include the hewing down of timber in the forest and the transforming of it into the many utilitarian shapes and forms required by modern standards of living. Thus they provide the raw material for sawmills, pulp and paper mills and for the still wider range of secondary industries that take the products of these basic industries and convert them into more highly manufactured goods such as veneers and plywoods, sash and doors, furniture and all the vast range of industries that use wood in any form in their processes. These industries, especially the pulp and paper industry and the lumber industry, contribute substantially to the value of Canada's export trade and thereby provide the exchange necessary to pay for a large share of the imports that have to be purchased from other countries, particularly the United States.

### Subsection 1.—Woods Operations

In connection with operations in the woods, it should be borne in mind that the forests not only provide the raw materials for the sawmills, pulp-mills, wood distillation, charcoal, excelsior and other plants, but that they also provide logs, pulpwood and bolts for export in the unmanufactured state, and fuel, poles, railway ties, posts and fence rails, mining timber, piling and other primary products, which are finished in the woods ready for use or exportation. A number of minor forest products go to swell the total, such as Christmas trees, maple sugar and syrup, balsam gum, resin, cascara, moss and tanbark.

It has been estimated that operations in the woods during the logging season in 1948 gave employment amounting to 44,467,000 man days, and distributed \$347,000,000 in wages and salaries.

### 7.—Values of Woods Operations, by Products, 1943-48

<sup>1</sup> In estimating the annual drain on Canada's forest resources, certain converting factors have been used, each of which represents in cubic feet the quantity of merchantable wood used to produce one unit of the material in question. The factor for logs and bolts for the British Columbia coastal region is 175 and for the rest of Canada 200. Other factors: pulpwood 85, firewood 80, hewn railway ties 5, poles and piling 15, fence posts 1.2 and wood for distillation 80. A change in computing the converting factor was introduced in 1944-45 and is described at p. 265 of the 1945 Year Book.

### Subsection 2.—The Lumber Industry

The manufacture of sawn lumber is the second most important industry in Canada depending on the forest for its raw materials.

The total number of sawmills, tie, shingle, lath, veneer, stave, heading and hoop mills and mills for cutting-up and barking or rossing of pulpwood that reported in 1948 was 7,035, as compared with 6,481 in 1947. Employees numbered 56,756 and wages and salaries amounted to \$95,065,676. The logs, bolts and other materials and supplies of the industry were valued at \$208,568,170, the gross value of production was \$409,267,472 and net value \$196,936,196.

Lumber production in Canada reached its maximum in 1948 at 5,908,798,000 ft. b.m. Average values were fairly uniform up to 1916, but increased rapidly from 1917 to 1920, to decline gradually during the following years to the lowest level for the entire period in 1932. With the exception of 1938, increases took place each year from 1933 to 1948.

### 10.—Quantities and Values of Lumber and All Sawmill Products, by Provinces, 1947 and 1948

**Lumber Exports.**—For exports of planks, boards and square timber see the Foreign Trade Chapter.

## Subsection 3.—The Pulp and Paper Industry

The rapid development of the pulp and paper industry is traced briefly at p. 265 of the 1940 Year Book. Summary statistics for the combined pulp and paper industries are given at p. 463 of this volume.

All statistics for 1949 in this subsection include the Province of Newfoundland for the full year for purposes of fair comparison, although the new province formally entered Confederation on March 31. However, for 1948 and earlier years Newfoundland is excluded, since it was not then a part of Canada. This should be kept in mind when comparing 1949 figures with those for previous years.

There are three classes of mills in the industry. In 1949, 32 were making pulp only, 27 were making paper only and 64 were combined pulp and paper mills.

The industry in Canada includes three forms of industrial activity, operations in the woods with pulpwood as a product, the manufacture of pulp and the manufacture of paper. Some of the important pulp companies operate sawmills to utilize the larger timber on their limits to the best advantage, and some lumber manufacturers divert a proportion of their spruce and balsam logs to pulp-mills. Less than one-fifth of the pulpwood cut in Canada is exported in raw or unmanufactured form and a large proportion of such exports is cut from private lands.

### 13.—Production, Consumption, Exports and Imports of Pulpwood, 1940-49

NOTE.—Figures for earlier years will be found in the corresponding tables of previous Year Books.

Year	Apparent Total Production of Pulpwood in Canada			Canadian Pulpwood Used in Canadian Pulp-Mills		Canadian Pulpwood Exported Unmanufactured		Imported Pulpwood Used in Canada	
	Quantity <sup>1</sup>	Total Value	Average Value per Cord	Quantity <sup>1</sup>	P.C. of Total Production	Quantity <sup>1</sup>	P.C. of Total Production	Quantity <sup>1</sup>	P.C. of Total Consumption

<sup>1</sup> All quantities are given in terms of rough or unpeeled wood.

The manufacture of pulp, the second stage in this industry, is carried on by mills producing pulp only and also by paper manufacturers operating pulp-mills in conjunction with paper-mills to provide their own raw material. Such mills usually manufacture a surplus of pulp for sale in Canada or for export. Spruce, supplemented by balsam fir in the east and by hemlock in the west, is the most suitable species of wood for the production of all but the best classes of paper.

The preliminary preparation of pulpwood is frequently carried on at the pulp-mill, but there are also a number of 'cutting-up' and 'rossing' mills operating on an independent basis, chiefly for the purpose of saving freight on material cut at a distance from the mill or on material intended for exportation. Pulpwood is measured by the cord (4' by 4' by 8' of piled material). One cord of rough pulpwood contains approximately 85 cu. ft. of solid wood, and one cord of peeled pulpwood 95 cu. ft.

**Pulp Production.**—Of the total 1949 pulp production 76 p.c. was made in combined pulp- and paper-mills for their own use in manufacturing paper. The remainder was made for sale in Canada or for export. About 60 p.c. was groundwood pulp and over 17 p.c. unbleached sulphite fibre, these being the principal components of newsprint paper. Bleached sulphite, bleached, semi-bleached and unbleached sulphate, soda fibre, semi-chemical, other grades and groundwood and chemical screenings made up the remainder. A considerable market has developed for screenings in connection with the manufacture of rigid insulating boards.

The manufacture of the 7,852,998 tons of pulp produced in 1949 entailed the use of 10,243,467 cords of rough pulpwood valued at \$240,379,337 and the equivalent of 154,580 rough cords of other wood (i.e., sawmill chips, slabs and edgings, sawdust, butt cores, etc.) valued at \$2,157,141. The total value of materials used in the manufacture of pulp was \$272,681,606.

#### 14.—Pulp Production, Mechanical and Chemical, 1940-49

<sup>1</sup> Includes Newfoundland exports for full year.

**World Pulp Statistics.**—Figures of production, exports and imports of pulp for certain countries of the world have again become available after the interruption caused by the War and are shown for 1949 in Table 17. It is estimated that these countries produce approximately three-quarters of the world supply of pulp.

### 17.—Production, Exports and Imports of Wood Pulp, by Leading Countries, 1949

(Source: United States Pulp Producers Association)

Country	Production	Exports	Imports
	'000 tons	'000 tons	'000 tons
Canada (including Newfoundland).....	7,798 <sup>1</sup>	1,557	35
United States.....	12,157	122	1,764

<sup>1</sup> Includes Newfoundland exports for full year.

**World Newsprint Statistics.**—Since 1913 Canada has led the world in the export of newsprint. During the war years world figures of newsprint production and exports were not obtainable. However, figures for the leading producing countries have again become available from the Newsprint Association of Canada and are given for 1949 in Table 21. The 1939 figures are included for comparative purposes. The six countries listed accounted for 83 p.c. of the estimated world production in 1949, Canada alone contributing over 56 p.c.

### 21.—World Newsprint Production and Exports, by Leading Countries, 1949 compared with 1939

<sup>1</sup> Slightly lower than Dominion Bureau of Statistics figures given in Table 18 because of the exclusion of certain paper not classed as newsprint by the Association.

**Statistics of the Combined Pulp and Paper Industries.\***—The manufacture of pulp, the manufacture of paper and the manufacture of products made of paper may, under certain conditions, be treated as three industries, for they are frequently carried on in separate plants by entirely independent companies. The manufacture of basic stock and the converting of this paper into stationery and other highly processed paper products are often combined in one plant. This further converting of paper within the pulp and paper industry itself represents only a small part of Canada's production of converted paper and boards, the bulk of which is still made in special converting mills classified in other industrial groups.

The presence of these different combinations in one mill makes it difficult to separate many of the statistics relating to the manufacture of pulp, basic paper and converted paper products. All converting operations carried on in paper-mills in this industry are attributed to the particular industrial group of converting plants to which they properly belong. Including manufacturing operations as far as the basic paper-making stage, there were altogether 123 mills in operation in 1949. The employees numbered 52,050 and their salaries and wages amounted to \$157,703,868. If the pulp made for their own use in combined pulp and paper mills is disregarded, the total value of materials and supplies used in the industry as a whole can be considered as amounting to \$348,662,719 in 1949, \$349,244,083 in 1948 and \$295,444,332 in 1947; the gross value of production as \$836,148,393 in 1949, \$825,857,664 in 1948 and \$706,971,628 in 1947; and net value of production, \$423,375,527 in 1949, \$412,770,470 in 1948 and \$356,084,900 in 1947.

The pulp and paper industry is one of the leading single manufacturing industries in Canada. In 1948 it was first in net value of production, in gross value of production and in salaries and wages paid, and third in employment. Only the manufacturing stages of the industry are considered in these comparisons, no allowance being made for capital invested, men employed, wages paid or primary products sold in connection with the woods operations. These form an important part of the industry as a whole but cannot be separated from woods operations carried on in connection with sawmills and other industries. In world trade, generally speaking, pulp and paper are Canada's main commodities; usually greater than wheat and far greater than nickel. Newsprint alone, over a considerable period, has brought Canada more export dollars than wheat, nickel or any other single commodity.† The United States market absorbs, annually, practically all pulpwood exports and over 80 p.c. of the pulp and the paper shipments of Canada. About one-half of the paper consumed in the United States is either of Canadian manufacture or is made from wood or wood-pulp imported from Canada.

At pp. 427-430 of the 1948-49 Year Book information is given on the veneer and plywood industries, the wood-using industries, and the paper-using industries.

\* See Chapter XVII and the Index for further particulars regarding the pulp and paper and paper-converting industries.

† For reasons given in Section 1, Part I of Chapter XXII, gold is excluded from Canadian trade statistics.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

### Section 1.—History of the Fur Trade

A historical outline tracing the development of the fur trade is published at pp. 281-282 of the 1946 Year Book. See also list of Special Articles under Fur Trade at the front of this volume.

### Section 2.—The Fur Industry

#### Subsection 1.—Fur Trapping

The fur resources of Canada are among its most valuable wildlife assets. With the increase in human population and the advance of settlement, the principal trapping of fur animals has moved farther northward. The raising of fur-bearers on farms has undergone marked development but the greater proportion of Canadian furs is still obtained from the wild.

Many animals, including some of the most valuable fur-bearers, are subject to marked fluctuations in numbers during successive years. In some species, the periods of abundance and of scarcity recur with sufficient regularity to be called cycles and these cycles influence the number of pelts taken annually.

The conservation of fur-bearing animals has long been a responsibility of federal and provincial authorities and is receiving increasing attention each year. It requires careful management of wild fur-bearers that is analogous in many ways to management of domestic animals, though the means of control are different. Scientific studies reveal much detailed information about the principal factors that cause fur-bearers to increase or to decrease. The principal factors are food, space, shelter, weather and enemies, including diseases, parasites and predators. At times a rising demand for furs, accompanied by higher prices, has brought about a tendency toward trapping too high a proportion of the available stock, which tendency must be met by increased restrictions. Great changes in the supply of food and shelter available to fur-bearers in large areas have resulted at times from forest fires, floods and drought but, if the damage is not too deep, skilful management practices can restore production in these areas more rapidly than was possible a few decades ago.

In northern Canada, where trappers are widely scattered over vast areas, control of the take of fur-bearers by prohibition, close seasons and enforcement of trapping regulations presents difficulties not encountered in other areas. Through

increased staffs of game officials, better education of the trappers in conservation practices, and more complete information concerning the areas involved, the effectiveness of regulations for the conservation of wildlife shows a continuous improvement.

Conditions for the production of certain fur-bearers, especially beaver and muskrat, are readily improved through rehabilitation of the marshes and water areas that constitute their homes.

All provinces and territories now have trapping regulations and individual trappers are licensed. Some provinces register trap lines, others register trapping areas. These steps provide an incentive toward conservation measures on the part of the individual trapper who, in his own interest, will protect his area against poaching and will guard against 'over-trapping' or other unwise procedures that might wipe out local populations of fur-bearers on which his livelihood depends.

### Subsection 2.—Fur Farming\*

In the early days of the fur trade, it was the practice in Canada for trappers to keep foxes alive until the fur was prime, and from this custom has arisen the modern fur-farming industry. The earliest authentic record of raising foxes in captivity comes from Prince Edward Island, where about 65 years ago a number of foxes were raised on a farm near Tignish. After 1890, a period of rising prices for furs encouraged fox-farming and the industry grew rapidly. The beauty of the fur of the silver fox (a colour phase of the common red fox established through selective breeding carried on by the pioneer fox farmers) and the consequent high prices realized from the sale of the pelts, caused attention to be directed chiefly to this breed. While experiments were being carried on in Prince Edward Island, attempts at raising foxes in captivity were also being made in other provinces; the records show that foxes were successfully bred in Quebec in 1898, in Ontario in 1905 and in Nova Scotia in 1906. The profitableness of fur farming became widely known in 1910 when prices obtained for the first silver-fox pelts sold at auction in London, England, were published. An average of \$1,339 per pelt was received on the sale of 25 pelts, one alone bringing the sum of \$2,627. A boom followed but this collapsed in 1914 and it was some time before the industry regained stability. Fur farming is now carried on in all provinces. An experimental fox ranch is operated by the Federal Government at Summerside, P.E.I., where problems of breeding, feeding, housing and general care are studied.

The first recorded account of fox farming in Newfoundland appeared in the minutes of the Game and Inland Fisheries Board which stated that between July, 1913, and November, 1915, there were over 1,000 applications for export of live foxes and 750 permits were granted. At that time the law prohibited the export of live foxes except where they were raised in captivity. In October, 1915, there were 315 ranches with 2,600 foxes, most of which were wild animals taken from burrows in the spring. In 1947 there were six fox farms with 180 females and 80 mink farms with 2,000 females. Mink ranching began with importations from Canada in 1936. Fur farmers and exporters are licensed and it is necessary to obtain a licence to export live fur-bearing animals. Since 1936 the Newfoundland Government has conducted a fur-farm training school at St. John's where experimental work on feeding has been carried on.

\* Revised in the Agriculture Division, Dominion Bureau of Statistics.

Although the fox was the first fur-bearing animal to be raised in captivity, many other kinds are now being bred—mink, raccoon, skunk, marten, fisher and chinchilla. Mink are the most numerous and the most valuable of such farm-raised animals. From 1920 to 1939 there was a rapid expansion of fur farming in Canada and during that period there was a marked change in the type of furs that were most acceptable to the market. Black fox was popular 25 years ago. A few years later the highest prices were being paid for quarter and half silvers and during recent years the full silver and new types have been setting the upper price limit. The development of new colour phases in foxes and mink proved an incentive to the fur-farming industry. New-type fox such as platinum, platinum-silver, pearl-platinum and white-marked have met a ready market as have mutation mink including silver-sable, platinum, silverblu, pastel and a number of other colour phases. For 1949, however, new type fox has lost place relative to mutation mink. In recent years chinchilla farming has been increasing and an association, the National Chinchilla Breeders of Canada, has been formed. Chinchillas are now registrable under Live Stock Registrations of the Federal Department of Agriculture.

### Section 3.—Statistics of Fur Production\*

**Total Fur Production Statistics.**—Early records of raw-fur production are confined to the decennial censuses, when account was taken of the numbers and values of pelts obtained by trappers. In 1920 the Dominion Bureau of Statistics commenced an annual survey of raw-fur production, basing its statistics on information supplied by the licensed fur traders. This survey was continued for some years. More recently, annual statements, based on royalties, export tax, etc., have been made available by the provincial game departments (except Prince Edward Island), and these statements are now used in the preparation of the statistics issued annually by the Bureau. In Prince Edward Island, the statistics are based on returns supplied to the Dominion Bureau of Statistics by traders in furs from that Province.

<sup>1</sup> Approximate.    <sup>2</sup> Exclusive of Newfoundland.

Ontario leads the provinces in value of fur production, accounting for 25 p.c. of the total in the 1948-49 season. The number of pelts taken in either Alberta, Saskatchewan or Manitoba was higher than in Ontario, but in these provinces muskrat and squirrel, which are lower-priced furs, made up the major portion of the total. In Ontario the more valuable mink, beaver and fox pelts brought the total value to a much higher level.

\* Revised in the Agriculture Division, Dominion Bureau of Statistics.

<sup>1</sup> Exclusive of Newfoundland.

The average price of most kinds of pelts taken in 1948-49 was lower than in 1947-48. All types of fox pelts, with the exception of white-marked fox, decreased, silver fox dropping from \$12.33 per pelt to \$12.19 and new-type fox from \$18.20 to \$16.95. Standard mink was also down from \$16.77 to \$13.20 and mutation mink from \$20.01 to \$15.49. The average value of beaver pelts was \$32.36 in 1947-48 as compared with \$20.72 in the later year, muskrat dropped from \$2.67 to \$1.49 and squirrel from 62 cents to 24 cents.

<sup>1</sup> Exclusive of pelts taken in Newfoundland.

**Fur Farm Statistics.**—There was a reduction in the number of fur farms in 1948, there being 5,040 as compared with 6,147 in 1947. The greatest decline was in fox farms though the number of mink farms also decreased by 12 p.c. The demand for short-haired furs continued, but that for long-haired furs was not as high as in pre-war years. Value of land and buildings used for fur animals decreased by 7 p.c. in 1948. Capital value of the live animals also declined by 37 p.c. from the 1947 figures.

### Section 4.—Marketing of Furs

The first Canadian fur auction sale was held at Montreal, Que., in 1920 and since then that city has been the leading Canadian fur mart. To-day, auction sales are also held at Vancouver, B.C., Edmonton, Alta., Regina, Sask., and Winnipeg, Man. At Regina the Saskatchewan Government maintains a Fur Marketing Service to assist the producers in that Province.

**Grading.**—In 1939 the Federal Department of Agriculture introduced the grading of furs. One of the Department's main objectives in grading is to secure uniformity so that furs may be purchased by grade without the necessity of buyers from other countries personally examining the pelts. Grading offers many advantages to the producer as well as to the trade in general. It educates the rancher as to the proper value of his pelts, and creates an incentive to improve the quality of the product; it furnishes guidance in the planning of future matings, aids in raising the standard of quality of the entire crop of pelts and helps in advancing the level of prices for high-quality pelts.

**Exports and Imports.**—Prior to the Second World War, Canada marketed her fur pelts mainly in the United Kingdom but, since that market was practically dormant during the war years, the fur trade was carried on mainly with the United States. A definite revival of trade with the United Kingdom was shown in 1946, 1947 and 1948, in 1949 exports to the United Kingdom were lower by 39 p.c. than in 1948 but imports were a little higher.

The Canadian fur trade, both exports and imports, is chiefly in undressed furs, the value of dressed and manufactured furs going out of Canada or coming in making up a comparatively small proportion of the total. A large part of the exports consists, of course, of those furs which Canada produces in greatest abundance, mink being the most valuable, followed by beaver, muskrat and fox. On the other hand, such furs as Persian lamb, certain types of muskrat, rabbit, squirrel, sheep and lamb, which are not produced to any extent in Canada, make up the major portion of the imports.

Total exports and imports of all furs to and from the United States, the United Kingdom and all countries are given for the years 1946-49 in Part I, Section 3 of the Foreign Trade Chapter, Tables 13 and 14.

## Section 5.—The Fur-Processing Industry\*

The rather general term "fur processing" includes both the fur-dressing and -dyeing industry and the fur-goods industry. The former is concerned with the dressing or dyeing of pelts, on a custom basis, while the latter is a manufacturing industry that actually makes up fur goods such as coats, scarves and gloves.

Separate statistics of the fur-dressing and -dyeing industry were first obtained in 1917, when 12 establishments with 512 employees reported receipts of \$1,071,805. No analysis by type of the various skins treated was obtained before 1924, when eight establishments reported a revenue of \$1,120,895, the cost of dyes, chemicals and other materials used amounted to \$162,013 and salaries and wages of \$561,233 were paid to 539 employees. Of the 3,473,909 skins treated in that year, muskrat pelts made up 47 p.c., rabbit 19 p.c. and squirrel 10 p.c. By 1948 the number of skins treated had increased to 14,137,455, rabbit accounting for 43 p.c., muskrat for 27 p.c. and squirrel for 10 p.c. Other types of skins treated fluctuated very widely over the past quarter-century, the numbers being affected not only by climatic conditions under which trapping is carried on but also by the development of fur farming and, above all, by the vagaries of fashion. Principal statistics of the fur-dressing industry for the years 1946, 1947 and 1948 are given in Table 8.

\* Prepared in the Animal Products Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

## 8.—Principal Statistics of the Fur-Dressing Industry, 1946-48

Amount received for treatment of furs.....\$	5,010,539	4,530,478	6,126,532

Statistics for the fur-goods industry, on a comparable basis, are available from 1921, when 219 establishments reported a gross value of production of \$13,639,609, employees numbering 2,621 who received \$3,013,706 in salaries and wages. Cost of materials used in the manufacturing process totalled \$8,118,833. Principal statistics for the industry for the years 1946, 1947 and 1948 are given in Table 9.

## 9.—Principal Statistics of the Fur-Goods Industry, 1946-48

Item	-1946	1947	1948
Establishments.....No.	593	616	615
Employees on Salaries—			
Male.....No.	1,162	1,193	1,193

Value of products.....\$	57,737,516	57,541,628	66,384,085

Changes in living habits and standards that have taken place in the past quarter-century are reflected in the type of goods produced by the fur-goods industry. For example, in 1921 there were 31,604 ladies' fur coats and jackets produced whereas in 1948 the industry turned out 225,711 garments of this type. On the other hand, there were 4,655 men's fur coats and 1,037 men's fur-lined coats manufactured in 1921 but only 1,734 such coats in 1948. In 1921 horse-drawn sleighs were still reasonably plentiful and 4,461 fur robes were produced but by 1948 production had dropped to 18.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

The immense fishery resources of Canada are derived from the waters of the North Pacific and North Atlantic, and from numerous lakes and rivers of her inland provinces. Adjacent to the most prolific sea-fishing grounds on the globe, Canada ranks high in fishery production, and leads the world in monetary returns from the export of her fishery products.

The fishery is Canada's oldest primary industry, and is important to the economic life of the coastal provinces as well as the inland areas adjacent to waters where commercial fishing is pursued. Latest figures show that 113,000 persons are provided full or seasonal employment in the fisheries. Of this number 93,000 (including Newfoundland 35,000) are directly engaged in fishing, while the remaining 20,000 are employed in fish processing.

## Section 1.—The Canadian Fishing Grounds\*

Canada's fishing grounds fall naturally into three main divisions: Atlantic, Pacific and Inland, each with its own special characteristics.

**Atlantic Fisheries.**—The Atlantic fisheries of Newfoundland, Nova Scotia, New Brunswick, Prince Edward Island and Quebec together account for more than one-half the marketed value of all Canadian fish.

Cod is the most valuable Atlantic catch and is taken by the fishermen of the five provinces, with Newfoundland and Nova Scotia predominating. Other 'groundfish', so called because they feed at the sea bottom, are often taken with the cod. They include haddock, pollock, hake, cusk, rosefish and catfish. The flat-fish which inhabit the deep waters and are caught by Atlantic fishermen include: halibut, plaice, yellowtail, witch, flounder and skate. Lobsters come second in value among Atlantic fishery products and are caught mainly off Prince Edward Island, Nova Scotia and New Brunswick, but are also found in the waters off Quebec and Newfoundland. Other types of shellfish are clams and quahaugs, of which New Brunswick and Nova Scotia both produce considerable quantities, oysters chiefly from New Brunswick and Prince Edward Island and scallops from Nova Scotia. Mussels, winkles and crabs are marketed on a smaller scale. Of the fish species occurring in schools (pelagic fish) and those entering the river estuaries, herring is the most important. Immature herring landed in southwestern New Brunswick

\* Revised by the Department of Fisheries, Ottawa.

and marketed under the name of 'sardines' are of particular value. Other pelagic fish are the ubiquitous mackerel, smelts which are caught in large numbers off New Brunswick and elsewhere, Atlantic salmon, swordfish and many others. More than 30 different kinds of fish, shellfish and marine mammals such as seals and whales, are commercially taken by Canada's Atlantic fishermen. In addition, marine products such as Irish moss and other sea-grasses are harvested.

There is a fairly clear distinction to be made between two branches of the Atlantic fisheries. The shore fishery, which is the more important, is carried on in waters within 12 or 15 miles of land, while the deep-sea fishery is worked on the 'banks' farther away. Individual fishermen, fishing near their homes from small row-boats, sailboats, or motor-boats, produce the bulk of the landings of the shore fisheries. The Labrador Coast fishing is of a special type, being conducted mainly by Newfoundland fishermen who voyage there for the summer. Hand lines and trawl lines with individually baited hooks are the gear chiefly used in the shore fisheries to catch such fish as cod, haddock and halibut, but on the Island of Newfoundland the greater portion of the inshore cod catch is accounted for by cod-traps. Mackerel and herring are captured with seines, trap-nets and gill-nets; lobsters are trapped in 'pots'; while smelts are mostly caught in winter in box-nets and bag-nets through holes in the ice. Oysters are gathered from their beds by special rakes or tongs: scallops are landed by drags or dredges.

The traditional deep-sea fishing vessel is the schooner from 70 to 125 tons and beyond in size, nowadays propelled by an engine as well as by sails. It carries 12 to 24 fishermen who, once the fishing grounds are reached, fish in pairs from small boats called dories, using trawl lines. A comparatively small number of steam trawlers of 250 to 300 tons and many smaller vessels called "draggers" working out of Newfoundland and Nova Scotia ports catch fish in a large bag-like net or "trawl" dragged along the bottom of the sea.

The Atlantic fisherman, working as he does on his own or as a sharesman, living often in a small community remote from the larger markets and using not very elaborate equipment and traditional methods, is dependent on the greatly fluctuating fortunes of weather, fish runs and market conditions for his livelihood. There is now a trend, encouraged by Federal and Provincial Governments and by the co-operatives, towards improving equipment, fishing methods, and marketing facilities which will help to stabilize conditions.

A considerable proportion of the production of the Atlantic fisheries—mainly cod and related species—is traditionally salted and dried, in some places by modern methods, largely for export to the West Indies, South America and the Mediterranean countries. However, modern developments in refrigeration and transport have enabled the fisheries to dispose of an even larger part of the catch of almost all kinds of fish in the fresh or frozen state, mostly on the Canadian and United States markets. Much of this fish is sold as fresh or smoked fillets, ready for cooking. A substantial proportion of some species such as lobster, sardines, mackerel, haddock and other groundfish (chicken haddie), and tuna are canned and a smaller quantity of Atlantic fish is pickled. Liver and other vitamin oils are extracted from some species. Fertilizer and other non-food products are also manufactured as by-products. Herring provides the bulk of the bait for hand and trawl lines.

**Pacific Fisheries.**—The fisheries of the Pacific Coast are dominated by salmon, which accounts for over one-half the total value. Herring, together with anchovies and the erratic pilchard, contribute between one-fifth and one-quarter, and halibut

with other fiat-fish (soles and flounders) about one-tenth of the marketed value of the British Columbia catch. Grayfish, soup-fin and other sharks are rich sources of vitamin oil and, as such, are commercially important. Ling and black cod (not related to the true cod) are worth mentioning, and clams, crabs and oysters also provide a small source of income to fishermen. Tuna fishing, a more recent venture, holds fair promise of becoming one of the Coast's more important pursuits. A variety of other aquatic species, ranging from shrimps to whales, are among the catches of the British Columbia fishermen.

Almost all fishing in British Columbia waters is carried on within sight of land, and there are no very large fishing vessels; but even small boats, usually highly powered and equipped with modern mechanical gear, navigational aids and radio, travel long distances up and down the coast following the seasonal movements of the fish and taking advantage of open seasons in widely scattered areas.

Among the typical craft and gear used are the purse-seine boats, owned or chartered by processing companies and operated by crews of seven or eight who receive a share of the proceeds of the catch. These boats are important in the salmon fishery and account for the bulk of the herring and the once large pilchard catch. The purse-seine net is from 800 to 1,200 ft. in length, and is run off the boat in a circle around the fish and then drawn together under water, purse fashion.

Another important method of salmon fishing is that of using drift gill-nets which are set floating vertically in the water. Small quantities of herring and pilchard are also taken by this method and similar gear is used in the shark fishery.

Hook and line methods of fishing are found in many branches of the Pacific Coast fisheries. Trollers catch salmon and tuna. Lines set along the sea bottom are the chief halibut fishing gear and are also used to catch other groundfish and, to some extent, sharks. Handlines are used by men fishing from small boats for ling-cod, rockfish, shark, etc. Small trawl nets, pulled along the sea bottom by power boats or draggers, bring in most of the soles and gray cod and a variety of other fish.

Mobility, modern equipment and efficient marketing facilities characterize the Pacific fisheries which show a high degree of organization both among the fishermen and among the processing companies.

The greater part of the Pacific salmon catch is canned. This product enjoys a world-wide reputation for quality and is exported to many countries. Fresh and frozen salmon, halibut and many other species, including shellfish, are supplied to Canadian and United States markets. Herring is turned largely into fish meal and oil, as are the waste materials produced in the canning and filleting of other types of fish. The extraction of vitamin oils from livers and viscera is another important and growing branch of the industry.

**Inland Fisheries.**—Apart from being a great sport-fishing area, the inland waters of Canada, which comprise more than one-half the fresh water of the globe, also support important commercial fisheries, particularly in Ontario, the Prairie Provinces and as far north as Great Slave Lake in the Northwest Territories. Quebec, New Brunswick and Yukon have commercial inland fisheries on a smaller scale.

A great variety of fish is taken in these inland waters; whitefish, which occur in all the provinces, head the list, followed by lake-trout and pickerel or doré. Other species are sometimes of considerable local importance, such as saugers in Manitoba and eels in Quebec.

The Great Lakes, and the larger bodies of water in the Prairie Provinces and Great Slave Lake in the Northwest Territories are fished extensively in the summer, the fishermen using boats up to 46 ft. in length (e.g., the whitefish boats on Lake Winnipeg) as well as skiffs and canoes. Gill-nets and pound-nets are the chief gear. Production is channelled through permanent shore stations with docking, icing, cooling, grading and warehousing facilities.

Winter fishing on large and small lakes with gill-nets set through holes in the ice is carried on by teams of men, many of whom are only part-time fishermen with their chief occupation in farming, lumbering or the fur industries. Accommodation for the fishermen as well as handling facilities are available at hutted camps or in the form of mobile cabooses. Dog teams, horses, cars and snowmobiles are used to haul fish and equipment.

Most of the catch is marketed fresh or frozen, with a large proportion going to the United States.

## Section 2.—Governments and the Fisheries\*

### Subsection 1.—The Federal Government

The Federal Government has the sole legislative authority over both the coastal and inland fisheries of Canada [British North America Act 1867, sect. 91 (12)]. Under the Act, laws are made for the protection and conservation of the fisheries in all the provinces. The provinces, however, have property rights in the non-tidal fisheries. The Federal and Provincial Governments, under various arrangements, have divided the administrative (but not the legislative) authority over fisheries. The Federal Government legislates for and administers the fisheries in all Canadian tidal waters, except those of Quebec. In Quebec, the Provincial Government undertakes the enforcement of federal laws in respect of both tidal and non-tidal fisheries.

In the non-tidal waters of Canada the Federal Government administers the fisheries of Yukon, the Northwest Territories, Newfoundland, Nova Scotia, New Brunswick and Prince Edward Island. The non-tidal fisheries of the other provinces are administered by the provincial authorities which enforce, on behalf of the Federal Government, the federal laws regulating the fisheries.

**The Department of Fisheries.**—Being responsible to Parliament and the country for the conservation, protection and development of the fishery resources of Canada, the Federal Department of Fisheries has developed over the years a large field staff to carry out this work. The service is maintained through the Department, the Fisheries Research Board of Canada and the Fisheries Prices Support Board.

To administer the fishing regulations and other regulations under the various Acts, the Department maintains a staff of fishery officers and a number of patrol and protection boats on the East and West coasts. Fish culture is being extended to develop more adequate supplies of various species not only by artificial hatching, rearing and planting but by many other procedures such as stream and lake improvement, control of predatory factors, fry salvage and the construction of fishways.

\* Revised by the Department of Fisheries, Ottawa.

The Department, through its inspectors, helps the fish-processing industry maintain a high standard of quality and facilitates the marketing of fishery products by proper grading.

A staff of economists and market analysts study and interpret market trends both in the foreign and domestic fields and, in co-operation with the Department of Trade and Commerce and its Trade Commissioner Service, is undertaking work on the development and extension of export markets for Canadian fish.

Information and educational activities of the Department have been extended considerably to acquaint the public with the various aspects of the industry through printed material, films, radio and exhibitions, and to bring about a greater use of Canadian fish products.

An important part of Departmental services is in the field of conservation. Biological investigations by the Fisheries Research Board of Canada lay the basis for conservation measures that are put into effect by the Department. These measures apply particularly to those species that are intensively fished because of their popularity as a food, and are designed to enlarge and maintain a continuing yield to the fishermen. New fishing grounds are continually being investigated with a view to increasing employment and adding to the economic importance of the industry. Fisheries research scientists conduct many experiments to increase the availability of the raw material to the industry by the development of improved fishing techniques. Results of these experiments are made available freely to Canadian fishermen.

In addition to financing research in the biological and experimental fields to maintain and develop the country's fishery resources, the Government makes outright grants to facilitate development. These include the continuation of a wartime scheme of subsidies for the construction of certain types of draggers on the Atlantic Coast; subsidies for construction of bait freezer and storage facilities also on the Atlantic Coast; and a small annual bounty to Canadian deep-sea fishermen and vessel owners. The bounty represents the interest on the amount awarded to Canada in 1871 in recognition of certain fishing privileges accorded to the United States.

Educational assistance is given by payments to institutions that have agreed to carry out adult educational work among fishermen, particularly to prepare them for taking part in co-operative production and disposal of their products. Grants authorized for 1950-51 totalled \$80,000, of which \$46,000 was allocated to St. Francis Xavier University, N.S., for the Atlantic Provinces; \$24,000 to the College of Ste. Anne de la Pocatière, Que., for the Gaspé Peninsula and the north shore of the Gulf of St. Lawrence; and \$10,000 to the University of British Columbia.

**The Fisheries Research Board.**—Under the Fisheries Research Board of Canada Act, 1937 (c. 37) this Board has charge of all federal fishery research stations in Canada, the conduct and control of investigations of practical and economic problems connected with marine and fresh-water fisheries, flora and fauna, and such other work as may be assigned to it by the Minister of Fisheries. The Board consists of 15 members appointed for five-year terms by the Minister. Nine of the members are scientists from universities or other institutions engaged in research work bearing on fishery problems; four members represent the fishing industry;

and two members are from the Federal Department of Fisheries. The Board's activities are financed from moneys appropriated by Parliament. It may also use funds received for its work through bequests, donations and from other sources.

The Board operates seven main scientific stations, four dealing with biological problems and three, designated as experimental stations, dealing with the technological problems of the fishing industry. The biological stations are: the Newfoundland Biological Station at St. John's Nfld.; the Atlantic Biological Station, St. Andrews, N.B.; the Central Fisheries Research Station, Winnipeg, Man.; and the Pacific Biological Station, Nanaimo, B.C. The technological stations are: the Atlantic Fisheries Experimental Station, Halifax, N.S.; the Gaspé Fisheries Experimental Station, Grand River, Que.; and the Pacific Fisheries Experimental Station, Vancouver, B.C.

Special investigations are administered directly from the headquarters of the Board and are undertaken as problems arise. An Eastern Arctic Fisheries Investigation is presently being conducted in Ungava Bay and Hudson Strait.

The Executive Committee of the Board has direction and supervision of investigations which are of sufficient importance to the fisheries of Canada to be initiated by the Board or assigned to it by the Minister. This Committee is assisted by sub-executive committees, one for the Atlantic Stations, one for the Gaspé Station, and one for the Pacific Stations; also, by advisory committees, one for the Central Research Station and one for the Eastern Arctic Fisheries Investigation. Associated committees deal with special matters related to the work of the Board.

Biological studies and investigations are carried on in the interest of conservation, development and management of the fishery resources of Canada. The studies provide knowledge of the life history, growth rate, reproduction, distribution, enemies, diseases, etc., of the fishes, shellfish, and sea mammals. The close and important relationship of these studies and those of the physical-chemical and the biological aspects of oceanography undertaken in co-operation with other organizations are being steadily developed.

The Board's technological investigations in progress at the experimental stations are designed to increase knowledge of methods of preservation, processing and of recovery of by-products from fish and other marine organisms. These investigations include plant and product sanitation, design of processing equipment, development of artificial drying and smoking methods, freezing and storage studies, improved methods of quality control of fresh and frozen fish, bacteriology and chemistry of salt fish, and marine oil research.

**The Fisheries Prices Support Board.**—The Board was set up in July, 1947, under the Fisheries Prices Support Act of 1944. It now has six members representative of fishermen, management, and government, and is assisted by a full-time staff. Provision was made for the appointment of the sixth member upon the entry of Newfoundland into Confederation.

The Board functions under the direction of the Minister of Fisheries. It promotes orderly adjustment in the fishing industry, endeavours to ensure adequate and stable returns for fisheries and seeks to secure a fair relationship between the returns from fisheries and those from other occupations.

To achieve its objects, the Board has authority to buy quality fishery products under prescribed conditions and to dispose of them by sale or otherwise, or to pay to producers the difference between a price prescribed by the Board and the average

price the product actually commands. The Board, however, has no power to control prices nor has it any jurisdiction over operations in the fishing industry or fish trade.

Money necessary for dealings in fishery products is available to the Board from the Consolidated Revenue Fund to a maximum aggregate amount of \$25,000,000 but only on the recommendation of the Treasury Board and the authorization of the Governor in Council. Administrative expenses are met from a parliamentary appropriation voted for this purpose.

General economic conditions, particularly in the North American markets, were such, during the 1949-50 period, that the industry did not suffer any widespread loss of revenue and consequently there was no general demand for action by the Board. Nevertheless, the commodity and regional picture was spotty and required constant review. Depressed prices in the fish-oil market, both for marine oils and vitamin oils, called for much discussion and some indirect assistance from the Government in aiding the industry to market these products. The sealing industry of the Atlantic Coast region experienced a particularly difficult time with much lower prices prevailing for both oil and skins. At the close of the marketing year the problem of finding a satisfactory outlet for the 1949 salted cod production of Newfoundland was given detailed attention by the Board and the Government.

The generally low income position of many areas on the Atlantic Coast, due to causes other than price, gave rise to many individual requests for support action, but because of the nature of the problem the Board could do no more than to recommend action other than price support for the ultimate solution of such problems.

**International Agreements.**—Many of the grounds fished by Canadians are also frequented by fishermen from other nations, particularly from the United States. This problem and others, e.g., that of the migration of fish between Canadian waters and those outside the jurisdiction of the Government of Canada, are the subjects of international agreements.

Since 1933, under the *modus vivendi* which grew out of an unratified treaty of 1888, licences have been issued to United States fishing vessels permitting entry to Canadian Atlantic ports for purchases of bait and other supplies; an outline of the history of this development will be found on pp. 351-353 of the 1934-35 Year Book. Reciprocal privileges have also been extended on the Pacific Coast to United States vessels fishing for halibut. Canadian fishing vessels have been granted permission in United States and Alaskan ports. In 1950 these privileges were placed on a continuing basis by the Pacific Coast Port Privileges Treaty, which did away with the need for special annual legislation. Previous to 1950 Canadian halibut vessels received reciprocal privileges only in Alaskan ports. The privileges granted by Canada include permission to tranship catches, buy bait, ship crews, etc.

Two international Commissions, the membership and cost of which are shared equally between Canada and the United States, have been set up on the Pacific Coast to deal with the halibut and the Fraser River sockeye salmon fisheries, respectively. Investigations carried out under the Commissions' auspices, subsequent regulation and limitation of catches and, in the case of salmon, the construction of fishways, appear to have been successful in arresting and reversing an earlier trend towards depletion of these fisheries. Another case of restoring a depleted marine resource by international agreement and action is that of the Pacific fur

seals. The provisions of a quadripartite Agreement of 1911 between Canada, the United States, Russia and Japan continue to apply by virtue of a provisional Canadian-United States Agreement of 1942, although the original treaty has lapsed after being abrogated by Japan in 1941.

A step towards international action in the investigation and conservation of the fisheries in the Northwest Atlantic has been taken by the Governments of Canada, the United States and eight interested European countries that signed an International Convention for this area in February, 1949. The Convention came into force in 1950 when Canada was the fourth signatory power to ratify the Treaty.

An International Commission and panels for specified sub-areas will be established which, on the basis of scientific investigations, may make proposals to the interested governments for joint regulations of the fisheries in the interest of optimum conservation of the stocks of fish.

A Convention, signed in April, 1946, by Canada and the United States, not yet ratified, provides for the establishment of a Joint Commission to develop a comprehensive plan for the effective management and maintenance of the fisheries resources in the Great Lakes, connected waters, and part of the St. Lawrence River.

Canada is one of the 15 countries which are parties to the 1946 International Convention for the Regulation of Whaling which governs in some detail the conduct of whaling by fishermen of all the participating countries.

The Permanent International Council for the Exploration of the Sea, established in 1902, to which Canada sends an observer, co-ordinates oceanographic and fishery biological investigations conducted by its members in the Eastern North Atlantic, the North Sea and the Baltic Sea.

The most comprehensive of the international organizations having to do with fisheries is the Food and Agriculture Organization of the United Nations (FAO).<sup>\*</sup> In the field of fisheries, at present the FAO concerns itself primarily with the collection, analysis, interpretation, discussion and dissemination of information. This involves statistics (including statistical standards), information on fish resources, cultural and fishing methods, and technological information. The FAO Fisheries Division also organizes studies of economic conditions relating to certain fish commodities that have been suffering from chronic difficulties, assists in the organization of regional research projects, and is doing preparatory work on international commodity standards.

### Subsection 2.—The Provincial Governments

A general outline of the work undertaken by the Provincial Governments in connection with the administration of commercial and game fisheries, assistance to the industry, educational and research work, and conservation may be found at pp. 279-286 of the 1945 Year Book. The union of Newfoundland with Canada in 1949 added a new provincial administration whose work is covered at pp. 495-496 of the 1950 Year Book. Fishery statistics are given at p. 483 and will be found in greater detail at pp. 502-504 of the 1950 edition of the Year Book.

<sup>\*</sup> For an account of the work of the FAO in other fields, see pp. 359-361.

## Section 3.—Fishery Statistics\*

### Subsection 1.—Primary Production

The commercial fisheries of Canada yielded \$139,700,000 in marketed value in 1948, an increase of nearly 13 p.c. over the 1947 figure of \$123,900,000. Although the total quantity of fish landed in 1948 reached a new peak of 14,300,000 cwt., 7 p.c. higher than the previous record of 13,400,000 cwt. in 1945, the increase in marketed value was due mainly to higher average selling prices for many species, and the development of those products that command higher prices, particularly in foreign markets.

#### 1.—Marketed Values of All Products of the Fisheries, 1870-1949

Year	Value	Year	Value	Year	Value	Year	Value
	\$'000		\$'000		\$'000		\$'000
1870.....	6,577	1915.....	35,861	1932.....	25,957	1941.....	62,259
1875.....	10,350	1920.....	49,241	1933.....	27,497	1942.....	75,117
1880.....	14,500	1925.....	47,942	1934.....	34,022	1943.....	85,595
1885.....	17,723	1926.....	56,361	1935.....	34,428	1944.....	89,440
1890.....	17,715	1927.....	49,124	1936.....	39,165	1945.....	113,871
1895.....	20,199	1928.....	55,051	1937.....	38,976	1946.....	121,125
1900.....	21,558	1929.....	53,519	1938.....	40,493	1947.....	123,900
1905.....	29,480	1930.....	47,804	1939.....	40,076	1948.....	139,749
1910.....	29,965	1931.....	30,517	1940.....	45,119		

The three leading provinces, by marketed value of products, in 1948 accounted for 82 p.c. of the total for Canada; British Columbia's share was 42 p.c., followed by Nova Scotia with 26 p.c. representing a substantial recovery of the ground lost in 1947, and by New Brunswick with 14 p.c.

\* Revised in the Fisheries Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

<sup>1</sup> Yukon only.<sup>2</sup> Northwest Territories only.

In 1948, salmon retained the position it has held for more than fifty years as the leading fish, on the basis of marketed value; cod regained the second place, which in 1947 it lost to herring, and the latter returned to third position. Notable advances in order of value were shown by haddock, pollock, tuna, soles and blue pickerel, while clams, saugers and perch fell back considerably.

Table 4 shows the quantities landed (primary products only) in thousands of pounds, and values marketed (primary and secondary products) in thousands of dollars, of the main items of the commercial fisheries. Minor items, and secondary products not specifically derived from one particular kind of fish, are grouped in the item "Other".

## 4.—Quantities Landed and Values of All Products Marketed of the Chief Commercial Fisheries, 1944-48

NOTE.—The quantity landed excludes the weight of livers, but the value of liver products is included in the value for the species concerned.

<sup>1</sup> Excluding Northwest Territories.<sup>2</sup> Livers only were landed on the Pacific Coast.

The value of the equipment used in primary operations of the commercial fisheries increased by \$8,700,000 over the 1947 figure to \$67,300,000 in 1948. A rise in the total estimated value of craft of all types accounted for \$4,500,000 of the increase, and an addition of \$2,800,000 to the value of salmon and lobster gear was reported.

Of the total investment in the agencies of primary production, the sea fisheries employed 85 p.c., and engaged 47,366 men—117 more than in 1947. The inland fisheries, with a total of 18,749, showed an increase of 579 employed over 1947.

### Section 4.—Newfoundland Fisheries

The waters off Newfoundland yield an abundant harvest of fish that are in commercial demand. Cod is the most important and provides more than one-half the total value. Substantial contributions are made also by herring, haddock, lobster, rosefish, seals and whales.

The prosperity of the fishing industry of Newfoundland being entirely dependent on exports has long been very susceptible to the influence of world conditions; values rose in response to the demands for food diverted from their normal sources of supply by the two-world wars, and fell drastically when demand was curtailed by the intervening depression. The Newfoundland Fisheries Board established, in 1936 under the Commission of Government, has done much to improve the economy of the industry, by regulation, research and instruction in both production and marketing; since Mar. 31, 1949, the Board has operated as a federal agency responsible to the Minister of Fisheries.

Export values are the most accurate indication that can be given of the relative importance of the various species in the Newfoundland fisheries, and of the developments that have taken place in production and marketing in recent years—particularly in the direction of greater diversification of species handled and products marketed. However since Newfoundland entered Confederation, on Mar. 31 1949, her external trade figures have been merged with those of Canada, and it is impossible to ascertain the total value of the exports of fishery products of the Province because a substantial part of them is shipped to the mainland and subsequently exported from other provinces. The value of fishery exports shipped to foreign markets from Newfoundland ports during the year 1949 is estimated at just over \$20,000,000, of which 35 p.c. went to the United States; salted and dried cod accounted for 56 p.c. of the total. Statistics on an historical basis giving the production and exports of Newfoundland fisheries are given at pp. 502-504 of the 1950 Year Book.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

## Section 1.—Canada's Mineral Resources†

The mining industry in Canada has reached the point where in terms of contribution to the national income—the truest measure of the significance of any industry—it ranks second to agriculture among the primary extractive industries. It was credited with 3·3 p.c. of the national income of \$10,938,000,000 in 1947 (the latest year for which the subdivision of Canada's national income by industrial divisions is available), agriculture with 13·0 p.c., and forestry with 2·4 p.c. The leading industrial division was manufacturing, which supplied 30·2 p.c., followed by retail and wholesale trade with 15·2 p.c.

The contribution of the mining industry represents the net return to those engaged in basic mining, and that is the only quantitative means for comparing mining with manufacturing and other conventional industrial divisions. Mine products played a highly important part in the contribution of the manufacturing industries; such industries classified as using materials principally of mineral origin (domestic and/or imported) accounted for 39 p.c. of the gross value of all manufactured products in 1947. The construction industry also depends largely upon products of the mine and, in the case of transportation, mine products (domestic and foreign) consistently account for more than one-third of the volume of freight handled by Canadian railways, the proportion being 37 p.c. in 1948.

The event that started Canada on the road to being a great mining country, particularly in the production of metallic minerals, was the discovery of silver in the Cobalt area in 1903 during the construction of the Timiskaming and Northern Ontario Railway. The wave of exploration that followed that discovery and continued until forced to spend itself during the First World War gave birth to Cobalt,

\* Except where otherwise noted, this Chapter has been revised in the Mining, Metallurgical and Chemical Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

† Prepared under the direction of Marc Boyer, Deputy Minister, Department of Mines and Technical Surveys, by L. O. Thomas, Mineral Resources Division.

Porcupine, Kirkland Lake and other mining camps in Ontario; the Premier mine in British Columbia; the Siscoe mine in Quebec; and the Flin Flon mine on the border between Manitoba and Saskatchewan. The next wave of exploration began with the staking of the Horne mine at Noranda, Que., in 1921 and did not subside until the great world-wide depression of the 1930's. Included in what eventuated from this discovery were the gold and base-metal mines of the Noranda-Rouyn, Malartic, and Val d'Or areas of western Quebec; gold camps in the Patricia district of western Ontario; the Sherritt Gordon mine in Manitoba; and the mining of pitchblende at Great Bear Lake in the Northwest Territories.

In 1949 the mining industry's output which comprised 66 different mineral products compared with only about one-half that number 25 years ago was valued at a new peak of \$901,110,000, compared with \$474,602,000 in 1939 and \$64,421,000 in 1900. Canada ranked first in world production of nickel, asbestos, and the platinum metals; second in aluminium (from imported ore, however), zinc, gold, cadmium, selenium (the largest selenium plant in the world is at Montreal, Que.), tellurium and, probably, radium and uranium; third in silver; and fourth in lead, copper, and cobalt.

The strength the Canadian mining industry has acquired in metallic minerals, which in 1949 accounted for 60 p.c. of the total value of mineral output, is reflected in Canada's export trade. Including the credit of \$138,900,000 provided by gold in 1949 in Canada's current account with the United States, exports of non-ferrous metals (excluding aluminium) and their products realized \$471,500,000 (more than 90 p.c. being raw or partly manufactured materials), or slightly over 15 p.c. of the value of total exports in that year. On a value basis, nickel, copper, zinc and lead ranked among the first 13 commodities exported.

The outlook for substantial further progress in Canada's mining industry is unquestionably very encouraging, even when viewed solely in the light of recent discoveries and developments. One of the most important of these is the changing position as regards iron. This originated with the discovery of high-grade hematite at Steep Rock Lake in Ontario and is continuing with preparations for the development of immense deposits of high-grade ore on either side of the boundary between Quebec and the Labrador area of the Province of Newfoundland.

Another development is the greatly increased output of oil as a result of the discovery of the Leduc field near Edmonton, Alta., in February, 1947, and of other fields since then. The oil position of Canada and, perhaps, of the North American Continent will be very greatly changed. A pipe line is under construction from Edmonton to the lakehead at Superior, Wis., U.S.A. (see p. 519), and Canada may become ultimately one of the world's major producers of oil, exporting instead of importing that vital mineral, with, as a consequence, very favourable results to her general well-being nationally and internationally.

Among other significant events of late are:—

(1) The discovery of what is probably the largest known single source of titanium in the world at Lake Allard, Que., near the north shore of the St. Lawrence River, where over 200,000,000 tons of unusually pure ilmenite have been proved, and the projected production from it of titanium dioxide and iron, and later of titanium metal.

(2) Progress in the development of the Lynn Lake copper-nickel deposits in Manitoba, where sufficient ore is expected to be found to justify railroad construction.

(3) The establishment of reserves of natural gas in Alberta of such sufficiency as not only to satisfy that Province's requirements for a great number of years but also to permit consideration of its being piped to cities and towns outside the Province.

(4) The bringing into production of a large deposit of asbestos in Ontario, which, with the output from Quebec, will ensure the leadership of Canada in the production of that mineral for many years to come.

(5) The discovery of occurrences of radioactive mineral on the north shore of Lake Athabaska, Sask., near the east shore of Lake Superior, Ont., and at other localities.

In the paragraphs that follow a picture of mineral resources is presented by provinces and territories.

**Newfoundland.**—The more important minerals in Newfoundland's contribution of about 3 p.c. to Canada's mineral production in 1949, were (on a value basis) zinc, iron ore, lead, copper, fluorspar, silver and gold. The output of fluorspar far exceeded that credited to any other part of Canada, and only Ontario produced a greater quantity of iron ore.

The iron ore was mined, as it has been for 60 years, at Wabana, Bell Island, deposits, where improvements are under way that will decrease the cost of mining and strengthen the competitive position of Bell Island ore in world markets. Shipments in 1949, apart from 30,000 tons to United States, were disposed of almost equally between furnaces in the United Kingdom and those of the Dominion Steel and Coal Corporation at Sydney, N.S. The Province's output of iron ore will unquestionably reach much higher levels when the rich iron ore from the Quebec-Labrador deposits begins to move over the 360-mile railway—for the construction of which contracts are being let and which will carry the high-grade hematite to the St. Lawrence River.

Output of other metals comes from the large copper-zinc-lead mine at Buchans, one of the world's largest base-metal mines, which has been in production since 1928. In 1949 a shaft was sunk to the new orebody, discovered early in 1948, at a depth 1,000 feet lower than, and not far removed from, the shaft then being used.

Silver, gold, nickel, chromium, antimony, asbestos, and vanadium have been found but not in sufficient quantities to warrant exploitation. Copper, zinc, and manganese are known to occur in Labrador, also good deposits of gypsum but none developed, and a large deposit of pyrophyllite, which is worked intermittently.

**Nova Scotia.**—The total value of mineral production in Nova Scotia has increased by over \$25,000,000 since 1939, reaching a peak of \$56,093,000 in 1949. Coal is the outstanding feature of Nova Scotia's mining industry. Output in 1949, valued at \$47,998,000, was the highest yet reached in any year, and accounted for nearly 86 p.c. of the value of the Province's entire mineral output. However, in recent years the output of industrial minerals has shown greater expansion than that of coal. The production of gypsum increased from 634,960 tons in 1945 to

2,556,000 tons in 1949, the latter tonnage accounting for over 84 p.c. of the total for Canada. Over 97 p.c. of the barite produced in Canada comes from Nova Scotia and further increase is contemplated from a newly discovered deposit in Colchester County.

The metal output of the Province has been small in recent years. Some gold has been produced every year since 1862, the peak output of 29,943 oz. being attained in 1939. During the War the output fell off greatly and there has been no recovery since. A mere 64 oz. was recorded in 1949. That, together with 3 oz. of silver, represented the entire metal output of the Province for that year. Iron ore has been mined from 1876 to 1913, the greatest yearly output being 102,201 tons in 1893, and zinc-lead-copper ore, containing 25,574,000 lb. of zinc was removed in the period 1936-40. Consideration is being given to resuscitating the mining of zinc, which occurs in Cape Breton Island.

Nova Scotia ranked fourth among the Provinces in the output of clay products in 1949.

**New Brunswick.**—Coal was by far the outstanding item in New Brunswick's peak mineral output of \$7,134,000 in 1949. The output of 541,000 tons of coal, valued at \$3,911,000, produced from the Grand Lake Basin, was the largest in the Province's history. The principal other items, apart from clay products and other structural materials, included gypsum, natural gas and petroleum.

Gypsum has been produced each year in Albert County for more than 75 years—for a longer period than any other mineral product of New Brunswick, not excepting even coal, which ranks second in that respect.

Small amounts of petroleum and natural gas have been produced yearly from the Stoney Creek field since about 1910, their peak annual outputs being, respectively, 31,359 bbl. in 1941 and 828,603 M cu. ft. in 1913.

There has been no production of metallic minerals in New Brunswick other than 345,912 tons of iron ore and small tonnages occasionally of manganese ore. The greatest annual output of manganese ore was 584 tons in 1924. Deposits of copper, lead and zinc are common but exploratory work has so far failed to find one of commercial size.

**Quebec.**—Quebec, which ranks second to Ontario in mineral output, produces a wide variety of minerals. Production in 1949 reached a peak value of \$165,022,000, 18.3 p.c. of the total mineral value for Canada.

Asbestos, gold, copper and zinc are outstanding contributors to the mineral wealth of the Province. In 1949, despite a strike in the asbestos industry, those four mineral products accounted for more than 71 p.c. of the value of the Province's output of minerals.

Asbestos has been produced every year since 1879 and the output to the end of 1949 totalled 12,076,000 tons valued at \$521,493,000. The entire amount has come from the Eastern Townships of Quebec. Quebec leads also in the production of certain other industrial non-metallic minerals, most of which, however, are produced in small amounts; of these, magnesitic dolomite (now preferably called dolomitic magnesite) and brucitic limestones, mined only in Quebec, have been used to some extent for producing magnesium metal, but its main application is to the production of the greater part of Canada's requirements of basic refractories. No coal, petroleum or natural gas is produced in this Province.

The value of Quebec's output of metallic minerals, to which gold, copper and zinc contributed 95 p.c., made up more than one-half the value of the Province's total mineral output in 1949. In the production of each of these metals (gold, copper and zinc) Quebec holds second place among the provinces.

At one time the Eastern Townships were the source not only of all the gold produced in the Province, which was extracted from placer deposits, but also of all the copper, the most notable copper mine being the Eustis, which operated continuously for 74 years before closing down in 1939. It was not until the discovery and development of deposits in the Noranda-Rouyn and Malartic areas of western Quebec between 1923 and 1930 that metals, as a group, made any substantial contribution to the value of the Province's mineral output. The bulk of the gold and copper and the greater part of the zinc now produced comes from those mines. Outstanding is the great Horne copper-gold-silver-pyrite mine of Noranda Mines, Limited, the leading producer of both gold and copper. Selenium, tellurium, and silver are recovered as by-products in that Company's operations. Waite Amulet, Normetal, and most of the other base-metal mines in western Quebec yield both copper and zinc—only Golden Manitou produces lead in addition—and all contain gold and silver. Prominent among recent new producers in the area are the East Sullivan and Quémont gold-copper-zinc mines.

The two most notable base-metal producers outside western Quebec are Anaconda Lead Mines, Limited, which opened up the old Tétreault lead-zinc-gold-silver deposit, and New Calumet Mines, Limited, with its zinc-lead-gold-silver mine on Calumet Island in the Ottawa River.

Drilling near the head of York River in the Gaspé Peninsula has indicated the existence of a very large tonnage of low-grade copper ore. Near Sherbrooke, in the Eastern Townships, the Moulton Hill copper-zinc-lead-gold-silver mine is again being prepared for production.

No iron ore for the production of iron and steel is now mined in Quebec, but plans are under way to mine high-grade hematite from the huge deposits on the Quebec-Labrador boundary and to transport the ore over a 360-mile railway to Seven Islands on the St. Lawrence River and from there by boat to points of consumption.

Another outstanding project is connected with the titanium-rich iron-ore deposits of the Lake Allard district. A 27-mile railway from Havre St. Pierre on the north shore of the St. Lawrence River to the deposit is nearing completion. The ore will be processed at Sorel in five electric furnaces expected to be completed by the autumn of 1951. The plant will yield 500 tons of iron a day and 700 tons of titanium concentrate. Production of titanium metal must await the working out of an economic method of extracting titanium from the ore.

The Chibougamau-Bachelor Lake area, where several mines were partly developed several years ago, also shows indications of much activity. It has been made accessible by the recently completed permanent road from St. Félicien, a railway station in the Lake St. John region. New mineral discoveries in this district have been made and the possibilities for many more are held to be good.

**Ontario.**—Ontario has long ranked first among the provinces in mineral production. In 1949 its output was valued at \$323,369,000 an all-time high and 36 p.c. of the entire Canadian mining output for that year.

Metals have been the greatest factor in the mineral wealth produced in Ontario since early in the century. They accounted for 82 p.c. of the value of mineral output in 1949; in fact, they contributed as much as 49 p.c. to the value of all metallic minerals produced in Canada in that year. The output of asbestos at Matheson, Ont., (the first production from this province) will soon substantially increase the value of industrial minerals produced.

The Province's output of metals began with the discovery of silver at Cobalt in 1903 during the construction of the Timiskaming and Northern Ontario Railway. That discovery not only led to Cobalt winning almost immediate renown at home and abroad for its wealth in silver but gave promise of other mineral riches in the little-known country tapped by the new railway. Not many years later that promise was fulfilled in the discoveries upon which the rich mining camps found there to-day have been built up. Among these are the Porcupine-Kirkland Lake-Larder Lake area camps with their great gold mines like Hollinger, Dome, McIntyre, Lake Shore, Wright-Hargreaves, and Kerr-Addison—Ontario's biggest producer of gold. Subsequent gold discoveries include those in the northwesterly part of the Province, the Crow River and Red Lake areas in particular. Ontario in 1949 accounted for over 57 p.c. of the gold produced in Canada, all of the nickel and platinum metals, and much of the copper and the iron ore.

Nickel ranks next to gold in the amount contributed to the value of the Province's output since 1900, followed by copper, silver, and platinum metals. The source of all the nickel and platinum metals as well as much of the copper and silver has been, and still is, the nickel-copper ore of the famed Sudbury area, where the International Nickel Company of Canada, Limited, and Falconbridge Nickel Mines, Limited, have long operated. The former Company has under way a \$50,000,000-program designed to improve production methods, reduce costs, and make use of the large reserves of low-grade ore heretofore regarded as unprofitable, and the latter Company is engaged in work which will result in substantial addition to its ore reserves.

The Province's output of iron ore in 1949 was the highest recorded, 2,012,000 tons, the only other provinces contributing to the Canadian output being Newfoundland with 1,658,000 tons and British Columbia with 5,000 tons. The rise in Ontario's output after resumption of mining in 1939 following a lapse of 15 years has been most marked since late in 1944 when Steep Rock Iron Mines, Limited, began shipping ore from its mine at Steep Rock Lake, west of Port Arthur. That Company, through the development of a new orebody, aims at producing 4,000,000 tons annually by 1954 and Algoma Ore Properties, Limited, in the Michipicoten area, the other source of Ontario's production, has recently enlarged its sintering plant and has revealed a body of ore far more extensive than either the Helen or Victoria bodies now being mined.

Ontario in 1949 led in output of salt, quartz, structural materials and clay products, and ranked second in a number of other non-metallic mineral products, including fluorspar which is produced in only one other province, Newfoundland. Ontario is the only Canadian producer of nepheline syenite and graphite.

Recent developments include: the production of asbestos near Matheson; the coming into production of two new gold producers, New Dickenson Mines, Limited, and Campbell Red Lake Mines, Limited; revival of activity in the Cobalt silver camp; and intensive search for radioactive minerals as a result of a discovery of pitchblende in 1948 in the Alona Bay area on the east shore of Lake Superior.

**Manitoba.**—Copper, gold and zinc among the metals, gypsum and salt among the industrial minerals, and cement, have figured prominently for a number of years in Manitoba's mineral output, which was valued at \$23,840,000 in 1949 as compared with a peak of \$26,081,349 in 1948.

The bulk of the copper and zinc produced to date, and much of the gold and silver, have come from the operations of the Hudson Bay Mining and Smelting Company, Limited, which brought into being the great Flin Flon copper-zinc-gold-silver mine and associated metallurgical plants. That mine, which grew out of the deposit discovered by Thomas Creighton in 1915, extends across the Manitoba boundary into Saskatchewan. The only other base-metal mine with a number of years of operation to its credit is the Sherritt Gordon at Sherridon, which yields copper, zinc, gold and silver, but is nearing the exhaustion stage of its known orebodies.

The outstanding gold mine in the Province is San Antonio in the Rice Lake area, which began production on May 1, 1932.

Recent developments in Manitoba's mining industry include: the commencement of milling of copper-zinc-gold-silver ore by Cuprus Mines, Limited, near Flin Flon and of gold ore by Ogama-Rockland Gold Mines, Limited, at Long Lake and by the Howe Sound Exploration Company, Limited, in the Snow Lake area; the exploration at depth, with initial results exceeding expectations, of the nickel-copper orebodies that Sherritt Gordon Mines, Limited, outlined by extensive surface diamond drilling at Lynn Lake, where the original discovery was made in 1945; and the construction by the Hudson Bay Mining and Smelting Company, Limited, of a \$5,000,000 zinc-fuming plant to recover metal contained in the zinc-plant residues that have accumulated since that Company began production of zinc from the ore of the Flin Flon mine.

**Saskatchewan.**—Apart from 130,000 tons of sodium sulphate, 2,000 tons of volcanic dust, and sand and gravel, coal comprised the entire output of Saskatchewan's mineral industry, prior to 1932. Since that year, metals have occupied a conspicuous position in the Province's mineral output, a result of the great copper-gold-zinc-silver mine at Flin Flon which the Hudson Bay Mining and Smelting Company, Limited, brought into production in 1930. That mine lies partly in Saskatchewan and partly in Manitoba.

The value of the Province's annual output of minerals increased greatly from \$1,681,728 in 1932 to a peak of \$36,055,000 in 1949, the latter figure being over four times higher than in 1939. The leading mineral by value in 1949 was copper at \$13,965,000, followed by zinc at \$8,513,000, and coal at \$3,534,000. The values of these three items as well as the tonnage of coal produced were the highest recorded for the Province. Gold, sodium sulphate and silver followed in that order on the basis of value of output.

The Lloydminster heavy-oil field is in its sixth year of production but competition from new sources of western oil and high transportation costs have kept the output of the wells below their productive capacity. The great success that has

attended drilling in Alberta since 1947 has stimulated intensive search for oil in Saskatchewan; over 30 parties using every modern type of geophysical equipment were in the field during 1949.

The Goldfields, Black Lake, and Lac la Ronge areas offer possibilities as sources of uranium and other rare metals and development work in 1949 was reported to have met with encouraging results.

In 1949 the first unit of a \$1,250,000 salt plant at Unity was in operation. Prior to that, production of salt in the Province was negligible.

**Alberta.**—The mineral output of Alberta is comprised almost entirely of fuels and structural materials (including clay products). In 1949, fuels accounted for over 93 p.c. of the total value of the Province's mineral production, which amounted to \$113,728,000. This was the highest figure ever recorded, exceeding the 1939 total by \$85,000,000. Alberta currently ranks fourth among the provinces in value of mineral production and in 1949 it accounted for more than 94 p.c. of the entire Canadian output of petroleum, nearly 85 p.c. of the natural gas, and over 45 p.c. of the coal.

The recent growth in the production of petroleum has been remarkable. Despite the declining output since 1942 of the Turner Valley field, which was the source of practically all the petroleum produced from 1914 to 1946, the output in the Province rose from 7,138,000 bbl. in 1946 to 20,087,000 bbl. in 1949.

The discovery in February, 1947, of the Leduc oilfield, 16 miles southwest of Edmonton, and the subsequent discoveries of Woodbend, Redwater and other areas, brought about new sources of petroleum and unquestionably very much higher levels of production will soon be reached. Output has had to be restricted until the pipe line, under construction from Edmonton to Regina and to the Head of the Lakes, is completed. This will permit great extension to the markets for Alberta oil (see p. 519).

The Redwater oilfield, discovered in 1948, is the greatest of the new discoveries to date. In 1949, 271 productive wells were brought in and the field's proven reserve was reported to be at least 360,000,000 bbl.

The natural gas reserves of the Province have grown concurrently with those of petroleum. They have now reached such a high level as to encourage the outlook for the export of that fuel. Other than fuels, salt is the leading industrial mineral produced.

**British Columbia.**—Metals predominate in British Columbia's mineral output which was valued at \$136,386,000 in 1949—more than twice the 1939 output. The peak annual value was \$148,223,614 reached in 1948, when metal prices averaged higher than in 1949. Metals contributed 81 p.c. to the provincial total value in 1949, and accounted for more than 20 p.c. of the value of Canada's entire metal output that year.

British Columbia ranked third among the Provinces in the value of its total mineral output in 1949 and was credited with all the bismuth, tin, antimony and indium produced, 83 p.c. of the lead, 79 p.c. of the cadmium, 50 p.c. of the zinc, 43 p.c. of the silver, 10 p.c. of the copper and 7 p.c. of the gold.

Most of the lead, zinc and silver recovered from British Columbia's mines comes from the great Sullivan mine of the Consolidated Mining and Smelting Company of Canada, Limited. The refined metals are produced at that Company's

metallurgical plants at Trail where, in 1949, customs shipments from 97 mining properties were also treated. Antimony, bismuth, cadmium, tin and sulphuric acid are obtained as by-products in the mining and smelting of base-metal ores.

Interest in the development of an iron and steel industry is being renewed. Deposits of iron ore on which some work has been done in the past include those at Zeballos, Quinsam Lake, and Texada Island, and there are other known deposits, including a number of magnetite deposits, upon which little or no development work has been done.

Coal is the only fuel currently produced in British Columbia: the Province supplied 10 p.c. of Canada's output in 1949. Interest is being shown, however, in the oil possibilities. Several areas are known to be geologically favourable to the deposition of oil and some serious prospecting and exploration was undertaken in 1949.

Other recent developments in the Province's mining industry include: the production of lead and zinc concentrates by Reeves MacDonald Mines, Limited, near the United States-British Columbia border and by Canadian Exploration, Limited, near Salmo; the commencement of milling in December, 1948, by Torbrit Silver Mines, Limited, which is the Province's leading straight silver producer; trial shipments of perlite rock (a natural volcanic glass) from the deposit under development at François Lake; and the practical recovery of indium at the Trail smelter.

**Yukon.**—Yukon's mineral output in 1949 was valued at \$5,099,000, compared with \$4,961,321 in 1939. The peak was \$22,452,857 in 1900, in which year the output of gold from the famed rich placers of Klondike, discovered in 1896, reached a maximum of 1,077,553 oz. valued at \$22,275,000.

Gold continues to be the leading factor in Yukon's contribution to the value of Canada's mineral output, accounting for \$2,951,000 in 1949, more than one-half of which was credited to the placer operations of the Yukon Consolidated Gold Corporation, Limited, in the Klondike district near Dawson. Silver ranked next in value, followed by lead and zinc, practically all of which were derived by United Keno Hill Mines, Limited, from the rich deposits of galena on Galena Hill in the Mayo mining district. The source of the small output of coal, 4,000 tons, which was sold for consumption at Dawson, Mayo and Whitehorse, was the Tantalus Bute mine in the Whitehorse mining district.

There has been renewed interest recently in the recovery of native copper from alluvial deposits in the upper White River area.

**Northwest Territories.**—The value of the mineral production of the Northwest Territories in 1949 was \$6,802,000, compared with the previous peak of \$4,267,000 in 1948 and \$3,249,000 in 1939. These values are exclusive of the pitchblende products resulting from the operations of Eldorado Mining and Refining (1944), Limited, a Crown Company, at Port Radium on Great Bear Lake, data concerning which are not available for publication. Gold mines contributed \$6,390,000 to the value in 1949 almost all the remainder being credited to the output of petroleum and natural gas at Norman Wells.

The area of greatest mining activity continues to be the Yellowknife River Valley, where four gold mines are producing—Con-Ryeon, Negus, Giant, and Discovery. Milling was initiated at the Discovery mine at the end of 1949. Production

from the Giant mine of Giant Yellowknife Gold Mines, Limited, the leading producer, began in May, 1948. The milling rate, which averaged 235 tons a day during that year, reached 400 tons at the end of 1949 and was expected to be at its capacity of 500 tons during 1950.

Occurrences of radioactive minerals in scattered localities, mainly around the easterly side of Great Slave Lake, were examined but no information concerning them has been published.

A syndicate backed by the Consolidated Mining and Smelting Company of Canada, Limited, is (1950) carrying out intensive exploration of lead-zinc deposits near Pine Point on the south shore of Great Slave Lake.

## Section 2.—Federal Government Aid to the Mining Industry\*

### The Department of Mines and Technical Surveys

The Federal Department of Mines and Technical Surveys, which came into being on Jan. 18, 1950, as a result of a departmental reorganization at Ottawa, continues the services, but in larger measure, rendered to the mining industry by the former Department of Mines and Resources. These services are effected mainly through its Geological Survey and its Mines Branch, and also through the Surveys and Mapping Branch and Dominion Observatories Branch.

**Geological Survey.**—The chief function of the Geological Survey is to map and report on the geology of Canada. Work by field parties is mainly in areas of known or potential mineral resources, and consists largely of systematic geological study and mapping of standard-sized areas on scales of 1 inch to 1 mile and 1 inch to 4 miles, together with detailed geological mapping on much larger scales in mining areas of special economic interest; and reconnaissance surveys in the lesser known regions of Canada.

Since the establishment of the Survey in 1842, geological maps on one scale or another have been prepared covering in all about 30 p.c. of the total area of Canada. In 1950, 83 parties were assigned to field work compared with 70 in 1949. Projects receiving particular attention include study of: the Quebec-Labrador iron belt; areas favourable to the accumulation of oil and gas in Western Canada and Ontario; and occurrences of radioactive minerals, mainly in the Northwest Territories and Saskatchewan.

Field work has been devoted to problems of fundamental and specific research, designed in part to assist the geologist in geological mapping, and in part to test the adequacy of new survey methods or the utility of special instruments in locating favourable oil or gas structures or important rare minerals. Of particular interest in the latter connection is the use of: gravimetric and seismic surveys in potential oil and gas fields; the geiger counter and scintillometer in the discovery of radioactive minerals; and the magnetometer or other geophysical equipment in mapping bedrock geology in drift-covered areas, and in detecting certain types of ore deposits.

The Geological Survey advises and assists prospectors and others engaged in mining development; acts as consultant to, and co-operates with, other government agencies engaged in development of or research on resources; and issues reports and maps embodying the results of its field investigations and office studies.

\* Prepared under the direction of Marc Boyer, Deputy Minister, Department of Mines and Technical Surveys, by L. O. Thomas, Mineral Resources Division.

The *Economic Geology Division* carries out special studies and research on the character, origin, extent, and geological relationships of various metallic and non-metallic mineral deposits and coal beds.

The *Oil and Natural Gas Division* conducts investigations that will assist in interpreting the subsurface geology of a region and in determining its oil and gas potentialities. It collects, prepares for examination, studies and correlates samples of drill cuttings or other records of wells bored for oil and natural gas.

The *Radioactivity and Mineralogy Division* engages in research on the mode of occurrence, association, properties and possible economic value of Canadian minerals; maintains an inventory of Canadian uranium occurrences; prepares and distributes mineral and rock collections for use of prospectors and educational institutions; and organizes and maintains a systematic collection of minerals for reference and exchange.

The *Division of Regional Geology* engages much of the work of the field staff, whose duty it is to map and report on the rock formations and associated ores and other economic materials in the various areas selected for geological study from year to year.

The three other Divisions are: *Palæontology; Ground-Water Supply and Glacial and Engineering Geology; and Geophysics.*

**Mines Branch.**—The *Mineral Dressing and Process Metallurgy Division* of the Mines Branch assists new mining ventures by work on determining the most efficient method of recovering metal contained in ore; assists mine operators in solving problems in milling practice; and develops new procedures to extend the use of mineral resources.

Its laboratory facilities are utilized at various times by mining companies for working out some particular process, employing their own staff with the co-operation and guidance of the Division's staff.

The *Physical Metallurgy Division* aids in the growth of the metal industries through the development of new alloys, new manufacturing techniques, and new applications; in the improvement of present practices in metal fabrication industries; and in the more effective use of metallic products by the consumer. Close co-operation is maintained with the National Research Council, particularly in the metallurgical work associated with the development of the atomic energy project at Chalk River, Ont.

The laboratories are, in reality, a collection of many laboratories, each equipped for a special purpose. The industrial laboratory is equipped to melt metals and produce ingots; and forging, rolling, extruding, die casting, welding, and heat treatment can be effected as in industrial plants. In the mechanical laboratory, metals are subjected to vibration, torsion, impact, compression and tension, and their reaction to all kinds of mechanical strain is observed, and in the physics laboratory their fundamental properties are studied through the use of X-ray and electron diffraction equipment, dilatometer, radioactive tracers, and gas analysis. In other laboratories the required instruments are available for the purpose of probing into other properties of metals and of making various studies as, for example, on the prevention of corrosion. Metallographic and spectrographic equipment is available in the Mines Branch for use of the Division, and chemical laboratories are equipped for any type of analysis.

The *Radioactivity Division* is concerned with the raw materials required in the production of atomic energy. It performs research directed to the development of new processes for the economic recovery of uranium from ore and makes concentration tests on many samples of ores from newly discovered uranium deposits. In addition, it assists the Crown-owned Eldorado Mining and Refining (1944), Limited, by developing methods to accomplish increased recoveries of uranium and to lower operating costs. Much of the Division's work is under strict secret classification.

The *Fuels Division* investigates Canada's fuel resources, their characteristics, and ways of processing, utilizing, and extending the markets for them. Work in the field or in its laboratories includes, for example: the investigation of methods of mining and preparing coal at collieries; the examination of peat, oil-shales, and bituminous sands in their natural states; combustion engineering tests on coals in different types of stoves and boilers, and in locomotive and stationary power plants; briquetting tests with and without the use of a binder; high-pressure hydrogenation tests on coal for the production of synthetic liquid fuel; and analyses of crude oils and natural-gas products.

There is much inter-relation of federal and provincial activities in regard to fuels. A current illustration of this is the establishment of a joint federal and Nova Scotia office and laboratory at Sydney, N.S., to investigate the nature and extent of the coal seams in Cape Breton. Another illustration concerns the pilot-plant project, recently terminated, for separating bitumen from Alberta bituminous sands by a method devised in the Mines Branch.

The *Mineral Resources Division*, through the wealth of data amassed over many years on mineral properties and operating mines, mineral exploration and development, processing and production, new research development, uses and marketing of minerals and their products, world sources of minerals and new discoveries, and on mining laws and taxation, provides a general mineral-information service that is freely used by government departments, mining and allied industries, and others interested in mining or its significance in the Canadian economy. A mineral-resources index inventory has been established of all known occurrences and mines both active and potential, special attention being given to occurrences of those minerals in which Canada is deficient.

The Division makes specific economic studies of various phases of the mining industry. It gives technical advice as required for the administration of the Emergency Gold Mining Assistance Act and prepares reports, on request, to aid the administration also of such matters as: tax exemptions on new mining properties; tax deductions as an encouragement to prospecting for base metals, other minerals and petroleum; and tax allowances for the drilling of deep-test wells for oil in unproven fields.

The *Industrial Minerals Division* investigates deposits of such minerals, examines industrial processes that utilize them, and carries out research on ways of recovering products of desired purity from minerals that, in their natural state, are too impure for industrial use. In this way it lessens the dependence of industry upon foreign sources of industrial minerals, which comprise all non-metallic minerals, including water, sands, clays, and rocks of economic value, but excluding the fuels. Waters from the major rivers and lakes throughout Canada are investigated for the benefit of industries as to their quality and suitability for various purposes. In addition, studies are made of ores of such alloying metals as cobalt, manganese, molybdenum, tungsten, and chromium.

In each of the last three Divisions mentioned, annual reviews on a number of minerals or their products are prepared giving information on new developments, production, trade and market conditions.

**Surveys and Mapping Branch.**—In 1947 all the surveying and mapping organizations of the former Department of Mines and Resources were combined in the Surveys and Mapping Bureau, which in January, 1950, was transferred to the Department of Mines and Technical Surveys as the Surveys and Mapping Branch.

The *Topographical Survey Division* provides base topographical maps that show all significant natural and artificial features fundamental to the study and economic development of mineral and other natural resources. It is organized in two major units: the Topographical Mapping Section, which is responsible for field surveys; and the Air Survey Section, which plots and produces maps from air photographs, with control provided by field surveys. In 1950, 73 field parties operated in various districts from Newfoundland to Yukon.

With the development of technique, instruments and mechanical aids to plotting maps from air photographs, topographical mapping practice has so changed that it is now held to be essential to have photographs of any area to be mapped. These are provided by the Royal Canadian Air Force and by commercial companies. Details of scale and priority of areas to be mapped are determined after consultation with the departmental branches concerned and, when applicable, with the Provincial Governments.

For the planned establishment, now about completed, of its mapping facilities, the Survey has 17 multiplex plotting units containing 144 projectors in operation, and is adding other necessary instruments and equipment as required.

The *Geodetic Survey Division* undertakes basic surveys of the highest order of accuracy for control (by means of nets of first-order triangulation, etc.) of mapping and of all other types of survey.

In regions such as northern Canada, not yet covered by accurate triangulation, where maps are required for prospective mineral and other development purposes, aerial photographs are used to map the country, and for the control points on which to base such aerial mapping the Geodetic Survey employs astronomical methods. These points, which are pin-pointed on the photographs, are indispensable for small-scale mapping.

The *Hydrographic Service Division*, in so far as its activities are directly related to mining are concerned, charts navigable waters in mining areas, as, for example, the Mackenzie River-Great Slave Lake area of the Northwest Territories.

**Dominion Observatories Branch.**—Included in the responsibilities of the Dominion Observatory at Ottawa is geophysical research in seismology, terrestrial magnetism and gravity, all such research being planned in collaboration with Canadian geological and mining organizations.

The *Seismology Division* makes field studies of all earthquakes and seismic studies of the earth's crust. It keeps in touch with methods of seismic prospecting for the location of oil and minerals. The data obtained from its research studies are furnished to seismic prospecting organizations and to construction engineers and insurance companies concerned with the evaluation of earthquake risk.

The *Terrestrial Magnetism Division*, in addition to providing data for the making of magnetic maps of a general nature useful to travellers, surveyors and geophysical prospectors supplies magnetic data continuously for the purposes of revising aeronautical and marine charts and the topographical map sheets.

The search for mineral wealth is facilitated by the Division's work because magnetic maps, studied in conjunction with geological maps, indicate areas where the magnetic field is distorted by mineralized formations.

The *Gravity Division* through its survey, which has been under way for many years, to provide a gravity map of Canada, is contributing to the research on crustal structure, particularly on the location of geological structures (faults, dykes, etc.) and mineral deposits. Salt in the Provinces of Prince Edward Island, Nova Scotia and New Brunswick, and pyrite, lignite, and sulphide deposits in Ontario and Quebec were located as a result of such research. The thousands of gravimeter readings already taken across Canada have proved of much aid to the mining industry, particularly in the search for oil.

### The Dominion Coal Board

The Dominion Coal Board was created in October, 1947 (11 Geo. VI, c. 57), and the functions and duties of the Board are clearly defined in the Act. The Board is charged with the responsibility of implementing the recommendations of the Royal Commission on Coal and the Act specifically states that it may undertake researches and investigations with respect to:—

- (1) the systems and methods of mining coal;
- (2) the problems and techniques of marketing and distributing coal;
- (3) the physical and chemical characteristics of coal produced in Canada with a view to developing new uses therefor;
- (4) the position of coal in relation to other forms of fuel or energy available for use in Canada;
- (5) the cost of production and distribution of coal and the accounting methods adopted or used by persons dealing in coal;
- (6) the co-ordination of the activities of Government Departments relating to coal.
- (7) such other matters as the Minister may request or as the Board may deem necessary for carrying out any of the provisions or purposes of this Act.

The policy of the Government to extend the market for Canadian coal was continued with success during 1949-50. The amount of coal moved under subvention for the year was 2,836,732 tons at a cost of \$3,918,017. The Coke Bounty Act, also administered by the Board, which places Canadian coal used in the manufacture of coke for metallurgical use upon a basis of equality with imported coal, provided a payment of 49.5 cents per ton on 718,000 tons for a total expenditure of \$355,351.

Continued study was given to problems relating to coal research and progress was made in connection with the co-ordinating of fuel purchases by the Government and the revision of coal specifications.

## Section 3.—Mining Legislation

**Federal Mining Laws and Regulations.\***—The Federal Government administers the mineral lands of Yukon and the Northwest Territories as well as those within Indian Reserves and in National Parks.

Mining laws and regulations covering Yukon and the Northwest Territories are administered by the Development Services Branch, Department of Resources and Development. Titles issued for federal lands, the property of the Federal Government, in these regions reserve to the Crown the mines and minerals that may be found on or under such lands, together with the right of operation.

\* Revised under the direction of Marc Boyer, Deputy Minister, in the Mineral Resources Division, Department of Mines and Technical Surveys.

Minerals on vacant and certain other federal lands may be acquired by lease for a period usually of 21 years, renewable for further periods of like duration, on the terms and conditions specified in the various Acts and regulations relating to federal lands.

The disposal of minerals in Indian Reserves is, with the exception of gold and silver, subject to the consent of the Indians owning the Reserve.

The Acts and regulations governing mining and quarrying on federal lands are summarized in Report No. 828 issued by the Mines Branch, Department of Mines and Technical Surveys, Ottawa, and entitled "Mining Laws of Canada". This publication also lists all the laws and regulations pertaining to mining on federal lands, and copies of these individual laws and regulations may be obtained by applying to the Development Services Branch, above mentioned. Another publication of interest in connection with mining regulations and available from the same source is entitled "Summary Review of Dominion Tax and Other Legislation Affecting Mining Enterprises in Canada".

**Provincial Mining Laws and Regulations.\***—All mineral lands lying within the boundaries of the several provinces (with the exception of those within Indian Reserves and National Parks which are under the jurisdiction of the Federal Government) are administered by the respective Provincial Governments.

The granting of land in any province, except Ontario, no longer carries with it mining rights upon or under such land. In Ontario, mineral rights are expressly reserved if they are not to be included. Some early grants in British Columbia, Alberta, Manitoba, New Brunswick and Quebec also included certain mineral rights. Otherwise, mining rights must be separately obtained by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (or veined minerals and bedded minerals), fuels (coal, petroleum, gas) and quarrying. Under these divisions of the provincial mining industry, regulations may be summarized as follows:—

**Placer.**—In those provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held and the royalties to be paid.

**General Minerals.**—These are sometimes described as quartz, lode minerals or minerals in place. The most elaborate laws and regulations apply in this division. In all provinces, except Alberta, a prospector's or miner's licence, valid for one year, must be obtained to search for mineral deposits, the licence being general in some cases but limited in others. A claim of promising ground of a specified size may then be staked. This claim must be recorded within a time limit, with the payment of recording fees, except in Quebec where no fees are required. Work to a specified value per annum must be performed upon the claim for a period up to ten years, or in Quebec work must be performed to a specified number of man-days with no time limit, when a grant or lease of the mining rights may be obtained, subject to agreement to develop as well as the payment of fees or an annual rental. The taxation most frequently applied is a percentage of net profits of producing mines or royalties. In the case of Newfoundland, the provincial mining tax has been modified, since Confederation on Mar. 31, 1949, to conform with the provincial obligations under the Dominion-Provincial Tax Agreement and no other form of taxation or royalties exists.

\* Compiled from material supplied by the Provincial Governments.

*Fuels.*—In those provinces in which coal occurs, the size of holdings is laid down and the conditions regarding work and rental under which they may be held. In Quebec ordinary mining claims give rights to all mineral substances and to their development, but stakings for oil or natural gas may cover 1,280 acres per claim. In some cases royalties are provided for. Acts or regulations govern methods of production. In the cases of petroleum and natural gas, an exploration permit or reservation is obtained. In Alberta the holder of such permit usually takes out a lease whether or not any discovery is made because exploration costs are in part applicable on his first year's rental. In other provinces, the discovery of oil or gas is usually prerequisite to obtaining a lease or grant of a limited area subject to carrying out drilling obligations and paying a rental, fees or a royalty on production.

*Quarrying.*—Regulations under this heading define the size of holdings and the terms of lease or grant. On Quebec private lands, the quarry belongs to the owner; on Crown lands mineral rights must be purchased.

Copies of the legislation and regulations and details concerning these may be obtained from the provincial authorities.

## Section 4.—Statistics of Mineral Production

The importance of mineral production as compared with other primary industries in Canada is indicated in Chapter X while its part in the foreign trade of Canada is dealt with in Chapter XXII, Part I, especially Section 4.

### Subsection 1.—Value and Volume of Mineral Production

*Historical Statistics.*—Definite records of the annual value of mineral production go back to 1886 only, although actual production began with the earliest settlements. The figures given in Table 1 are not strictly comparable throughout the whole period, minor changes having been adopted in methods of computing both the metallic content of ores sold and the valuations of the products. Earlier methods resulted in a somewhat higher value than those now in use would have shown. However, the changes do not interfere with the general usefulness of the figures in showing the broad trends in the mineral industry.

1.—Value of Mineral Production, 1886-1949

Year	Total Value	Value per Capita	Year	Total Value	Value per Capita	Year	Total Value	Value per Capita

			1938.....	441,823,237	39.62	1949 <sup>2</sup> .....	901,110,026	66.51

<sup>1</sup> Beginning with 1931, exchange equalization on gold production is included.  
of Newfoundland production.

<sup>2</sup> Includes value

**Current Production.**—The mining industry in Canada had one of its best years in 1949. Increases in output tonnages of the major minerals more than offset the effects of the declines in base-metal prices and the total value of mineral production showed a substantial advance to an all-time high of \$901,000,000. This value was nearly 10 p.c. greater than the \$820,000,000 for 1948, but it included data for Newfoundland for the first time. If the \$28,000,000 for the new province were excluded, the gain in value over 1948 would be reduced to 6 p.c. or \$53,000,000. The entry of Newfoundland into Confederation helped considerably in boosting the nation's output of iron ore, lead, zinc and fluorspar.

In volume of output, advances over 1948 were recorded for most of the leading minerals. Production of zinc increased 23 p.c. and copper was up 11 p.c.; gold advanced 17 p.c. and silver 10 p.c.; coal, crude petroleum and natural gas were at record levels, up 4 p.c., 73 p.c. and 23 p.c., respectively; cement increased 13 p.c. and stone 19 p.c. However, because of labour disputes the tonnage of asbestos was down 20 p.c. Output of gypsum declined 6 p.c., lead was down 6 p.c. and nickel 2 p.c.

Employment in the industry was probably higher in 1949 than in any other year. The official index of employment for the mineral industries averaged 100·9 (June 1, 1941=100) as against 98·0 in 1948, an increase of about 3 p.c. On this basis the number of employees was approximately 116,000 in 1949. Salaries and wages paid to these workers during the year totalled about \$290,000,000.

In the second quarter of 1949 the market prices for refined copper, lead and zinc fell off rather abruptly but recovered considerably during the last half of the year. Copper, which was quoted at 23½ cents per lb. on the New York market at the beginning of the year, declined to 16½ cents in June and closed the year at 18½ cents. Zinc which at the opening was 17½ cents per lb., receded to 9½ cents, and was quoted at 9¾ cents at the year end. Lead began the year at 21½ cents per lb., declined to 12 cents in June, rose to 15 in September, and averaged 12 cents in December. In terms of Canadian dollars, the average prices for the year were: copper, 19·97 cents; zinc, 13·25 cents; and lead, 15·80 cents; compared with 22·35 cents, 13·93 cents and 18·04 cents, respectively, in 1948.

Despite the lower average prices for these major items, the value of all metals recovered in 1949 was 10 p.c. above the corresponding figure for 1948 and the total of \$539,000,000 was, in fact, greater than for any preceding year. However, the quantities of copper, lead, zinc, nickel and gold were below the record amounts recovered in 1941 to 1943 when the war effort was at its peak.

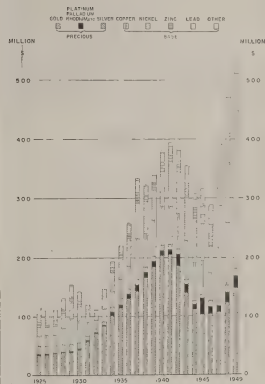

Output of structural materials was greater than in any previous year, the 1949 value of \$113,900,000 being about 8 p.c. above the 1948 total. Shipments of clay products, cement and stone were higher than in the previous year, but sales of lime, sand and gravel were considerably less.

The value of mineral fuels at \$183,700,000 was much greater than ever before. The principal advances were in crude petroleum and natural gas, but coal was up substantially. Other non-metallies declined slightly in output value principally because of the shut-down for several months of most of the asbestos mines.

<sup>1</sup> Not released for publication.<sup>2</sup> Includes minor items not specified.

Although the year 1926 was not a normal year in mineral production to the same extent as in some other productive fields, the rapid changes that have resulted from circumstances arising since then can be seen more clearly by using 1926 as a base year. Table 4 shows the indexes of volume of mineral production by principal minerals, for the years 1939-48.

### 4.—Indexes of Volume of Mineral Production, by Principal Minerals, 1939-48

### Subsection 2.—Provincial Distribution of Mineral Production

Since 1907, Ontario has been the principal mineral-producing province of Canada. In 1940, that Province accounted for 49 p.c. of Canada's total, but its share has declined steadily to 35 p.c. in 1949. Alberta's share of the total showed the greatest increase in the ten-year period, rising from 7 p.c. in 1940 to 13 p.c. in 1949, accounted for by the tremendous increase in crude petroleum output of that Province. The proportion contributed by Quebec increased in the same comparison from 16 p.c. to 18 p.c., British Columbia from 14 p.c. to 15 p.c., Nova Scotia from 6 p.c. to 7 p.c., and Saskatchewan from 2 p.c. to 4 p.c. Newfoundland produced almost 3 p.c. of the total mineral production of Canada in 1949. As compared with 1948, gains in value were registered for all provinces except British Columbia and Manitoba.

#### 5.—Mineral Production, by Provinces,<sup>1</sup> 1940-49

NOTE.—Figures for the years 1899-1910, inclusive, will be found at p. 345 of the 1933 Year Book; for 1911-28 at p. 323 of the 1939 edition; and for 1929-39 at p. 323 of the 1946 edition.

<sup>1</sup> Excluding Newfoundland, the total value of mineral production of Newfoundland for 1949 amounted to \$27,583,615.

#### 6.—Detailed Mineral Production, by Provinces, 1948

NOTE.—Quantities and values of minerals produced during 1948 in Yukon were—gold, 60,614 fine oz., \$2,121,490; silver, 1,718,618 fine oz., \$1,288,964; lead, 4,598,665 lb., \$329,599; coal, 3,801 tons, \$25,857; total, \$4,265,910; and in the Northwest Territories—gold, 101,625 fine oz., \$3,556,875; silver 25,382 fine oz., \$19,036; natural gas, 150,000 M cu. ft., \$15,000; petroleum, 350,541 bbl., \$676,574; total, \$4,267,485. Data for pitchblende, magnesium and quantity of magnesite-brucite are not released for publication. For Canadian totals of individual minerals, see Table 2. The ton referred to is the short ton of 2,000 lb.

## Subsection 3.—Production of Metallic Minerals

The metals of chief importance in Canada are copper, gold, iron, lead, nickel, those of the platinum group, silver and zinc. These metals are dealt with individually in the following paragraphs. In addition, there are a number of metals produced in minor quantities, principally as by-products in the treatment of metaliferous ores (see Tables 2 and 6).

**Copper.**—Copper production was greater in 1949 than in any other post-war year, amounting to 263,457 tons made up of 224,422 tons of blister copper and 39,000 tons of recoverable copper in matte and concentrates for export. While this tonnage represented a gain of nearly 10 p.c. over 1948, it was still much below the record of 327,797 tons attained in 1940.

Based on the yearly average price of approximately 20 cents per lb., the value of recoverable copper from Canadian sources in 1949 was \$105,000,000, being less than 3 p.c. below the record of \$107,000,000 in 1948. Output of refined copper totalled 226,000 tons in 1949 compared with 221,000 tons in the previous year. About 50 p.c. of this amount, or 127,000 tons, was shipped for export, chiefly to the United States and the United Kingdom. Consumption by Canadian users amounted to 101,000 tons. The copper content of concentrates and matte exported in 1949 was 39,000 tons.

About 43 p.c. of Canada's copper comes from the nickel-copper mines in the Sudbury district of Ontario. Converter copper is produced and further treated at Copper Cliff, and nickel-copper matte produced at Falconbridge is exported to Norway for refining. Mines in northern Quebec account for 26 p.c. of Canada's copper production. These ores are treated at Noranda to produce copper anodes which are shipped to Montreal, Que., for refining. Ores from the Flin Flon-Sheritt Gordon area in northern Manitoba, and extending over the border into Saskatchewan, are treated at that point and the blister copper recovered is also shipped to Montreal, Que., for refining. Mines in this area account for 20 p.c. of production. British Columbia mines account annually for about 10 p.c. of Canada's copper, and concentrates produced in this area are exported to the United States for treatment. Concentrates from Newfoundland, which amount to little more than 1 p.c. of the total, are exported to Belgium and to the United States.

### 7.—Copper Production, by Provinces, with Total Values, 1940-49

NOTE.—Figures for the years 1886-1910, inclusive, will be found at p. 272 of the 1916-17 Year Book; for the years 1911-28 at p. 335 of the 1939 edition; and for 1929-39 at p. 331 of the 1946 edition.

Year	Quebec	Ontario	Manitoba	Saskatchewan	British Columbia	Totals

<sup>1</sup> Includes 32,727 lb. valued at \$3,301 produced in N.W.T. in 1941; 74,963 lb. valued at \$7,561 in 1942; and 11,902 lb. valued at \$1,428 in 1944.

<sup>2</sup> Includes 7,233,952 lb. valued at \$1,444,837 produced in Newfoundland.

**Gold.**—There was steady improvement in the gold-mining industry during 1949 as the supply of labour and materials became a little easier and the provisions of the Emergency Gold Mining Assistance Act became effective. Further encouragement was provided by the increase in the value of gold to \$38.50 per Troy ounce in terms of Canadian dollars. These and other factors permitted many mines to return to a sound operating basis and encouraged some expansion in operations.

Production of gold from all sources in 1949 totalled 4,124,000 fine oz. Although this was from 20 p.c. to 25 p.c. less than the amounts recovered in the peak period from 1939 to 1941, inclusive, it was considerably better than in any other year in the history of the industry. Bullion from gold mines advanced 13 p.c. from 2,977,000 fine oz. to 3,359,000 fine oz.

The improvement in output from gold mines was quite general except for British Columbia. In the Porcupine district in Ontario the increase as compared with 1948 was from 999,000 oz. to 1,033,000 oz., in Kirkland Lake from 448,000 oz. to 478,000 oz., in Larder Lake from 204,000 oz. to 310,000 oz., and in the Patricia area from 219,000 oz. to 273,000 oz. In Quebec's gold mines output rose from 605,000 oz. to 707,000 oz., in Manitoba the increase was from 63,000 oz. to 107,000 oz. and in the Northwest Territories from 102,000 oz. to 178,000 oz. In British Columbia the production from lode gold mines was practically the same as in 1948 at 255,000 oz.

Recoveries of gold from base-metal operations increased from 371,000 oz. in 1948 to 472,000 oz. in 1949. The gain was mainly in Quebec, from 165,000 oz. to 265,000 oz.

The value of gold production in 1949 was almost 20 p.c. higher than in 1948.

### 8.—Quantities of Gold Produced, by Provinces, 1940-49

NOTE.—Figures for the years 1862-1910, inclusive, will be found at pp. 268-269 of the 1916-17 Year Book; for the years 1911-28 at p. 336 of the 1939 edition; and for 1929-39 at p. 362 of the 1946 edition.

<sup>1</sup> Includes value of production in Alberta amounting to \$8,277 in 1940; \$8,277 in 1941; \$1,309 in 1942; \$808 in 1943; \$1,963 in 1944; \$269 in 1945; \$4,042 in 1946; \$2,730 in 1947 and \$2,730 in 1948.

<sup>2</sup> Includes values of production in Newfoundland and Alberta amounting to \$333,684 and \$4,140, respectively.

**Iron.**—Deposits of iron ore in Canada are many and widespread, but because of the availability of low-cost, higher-grade ores in the Lake Superior area of the United States and the Wabana deposit in Newfoundland, no iron ore from domestic sources was produced in Canada from 1924 to 1939.

The development in the Michipicoten area of Ontario began in 1937 and the first sinter was produced in July, 1939. The high-grade deposits being worked at Steep Rock Lake west of Port Arthur, Ont., and the more recent discoveries of large deposits of iron ore in the Quebec-Labrador Boundary region (being developed) have greatly raised the potentialities of Canada as a producer of iron ore. In 1949 there were 3,675,000 tons of iron-ore produced, 2,012,000 tons of which came from Ontario and 1,658,000 tons from Newfoundland.

A special article on "The Iron-Ore Resources of the Quebec-Labrador Region" appears at pp. 505-512 of the 1950 Year Book.

#### 10.—Iron-Ore Shipments and Production of Pig-Iron, Ferro-Alloys and Steel Ingots and Castings, 1940-49

NOTE.—Figures for the years 1886-1910, inclusive, will be found at p. 373 of the 1936 Year Book; for the years 1911-28 at p. 340 of the 1939 edition; and for 1929-39 at p. 333 of the 1946 edition.

1948.....	1,337,244	438,430	1,682,309	2,125,739	232,734	3,200,480
1949 <sup>p</sup> .....	3,633,535 <sup>2</sup>	472,885	1,681,467	2,154,352	211,603	3,186,930

<sup>1</sup> Includes production of 1,272 tons in British Columbia, amounting to 1,657,600 tons.

<sup>2</sup> Includes Newfoundland shipments,

**Lead.**—About 80 p.c. of Canada's lead now comes from the Sullivan mine at Kimberley, B.C. Recoveries of lead from this property in 1949 were considerably less than in 1948 so, despite the addition of the large production from Newfoundland together with increases at other lead-producing properties, the output for all Canada dropped 6 p.c. to 160,000 tons, including about 145,000 tons in the form of lead bullion and 15,000 tons of recoverable lead in concentrates for export. The decline in total production in British Columbia was from 160,000 tons in 1948 to 132,700 tons.

In Quebec, the output increased to almost 6,000 tons in 1949 from 4,760 tons in 1948. Since there is no lead smelter in Eastern Canada the concentrates from this Province were exported for treatment chiefly to the United States and Belgium. The Newfoundland production of 19,000 tons in the form of concentrates also went mainly to the United States and Belgium.

The total value of lead production in 1949 was 16 p.c. lower than in 1948 but higher than in any other year.

Output of refined lead, all produced in British Columbia, totalled 146,000 tons compared with 160,000 tons in 1948. Consumption of new refined lead in Canada amounted to approximately 54,000 tons, of which about 45 p.c. went into white metal alloys such as solders, babbitts, etc., 15 p.c. into storage batteries, 15 p.c. into paints, and 25 p.c. into cable covering, collapsible tubes and other such products. Exports of refined lead in 1949 totalled 113,500 tons valued at \$36,725,000. Exports of lead in concentrates amounted to 19,890 tons worth \$4,741,000.

#### 11.—Quantities and Values of Lead Produced from Canadian Ores, 1940-49

NOTE.—Figures for the years 1887-1910, inclusive, will be found at p. 367 of the 1929 Year Book; for 1911-28 at p. 341 of the 1939 edition; and for 1929-39 at p. 333 of the 1946 edition.

Year	Quantity	Value	Year	Quantity	Value
	lb.	\$		lb.	\$
1940.....	471,850,256	15,863,605	1945.....	346,994,472	17,349,723
1941.....	460,167,005	15,470,815	1946.....	353,973,776	23,893,230
1942.....	512,142,562	17,218,233	1947.....	323,336,687	44,200,124
1943.....	444,060,769	16,670,041	1948.....	334,501,917	60,344,146
1944.....	304,582,198	13,706,199	1949.....	319,549,865 <sup>1</sup>	50,488,879 <sup>1</sup>

<sup>1</sup> Includes Newfoundland production amounting to 37,216,398 lb. valued at \$5,880,191.

**Nickel.**—About 90 p.c. of the world's nickel comes from the Sudbury area in northern Ontario. There are two large operators in this district, the International Nickel Company of Canada, Limited, which has a smelter at Copper Cliff and a nickel refinery at Port Colborne, Ont., and the Falconbridge Nickel Mines, Limited, which operates a smelter at the mine site but exports the matte to Norway for refining. Some nickel was recovered in the form of oxides and salts from Cobalt ores treated at the Deloro smelter of the Deloro Smelting and Refining Company.

Output of recoverable nickel in all forms amounted to 129,000 tons in 1949 compared with 132,000 tons in 1948. The record output was in 1943 at 144,000 tons. The value placed on the 1949 output was \$99,200,000.

Consumption of refined nickel by Canadian users was only about 1,750 tons in 1949, while exports totalled 69,088 tons. Exports of nickel in matte and oxide aggregated 58,054 tons.

#### 12.—Quantities and Values of Nickel Produced, 1940-49

NOTE.—Figures for the years 1889-1910, inclusive, will be found at p. 368 of the 1929 Year Book; for 1911-28 at p. 342 of the 1939 edition; and for 1929-39 at p. 333 of the 1946 edition.

**Metals of the Platinum Group.**—This group of metals includes palladium, rhodium, ruthenium, osmium and iridium, with platinum and iridium as the most important. These metals occur in the nickel-copper ore of the Sudbury district and are recovered in the tank residues from the nickel refinery at Port Colborne, Ont. The crude residues are sent to the refinery at Acton, England, for refining. The great increase in the output of nickel-copper ores has made Canada the leading producer of platinum since 1934, when it displaced Russia. The industrial uses of the platinum metals have expanded considerably in recent years, particularly in electrical and chemical equipment, jewellery and in medical and dental appliances. Canada produced 336,000 fine oz. of platinum metals for a total value of \$19,893,000, in 1949.

### 13.—Quantities and Values of Platinum and Palladium Produced, 1940-49

NOTE.—Records of the platinum production in Canada go back to 1887 but, prior to 1921, the amounts were comparatively small and the basis of calculation was not comparable with that now used. Figures for the years 1921-39 will be found at p. 340 of the 1940 Year Book.

Year	Platinum		Palladium <sup>1</sup>		Year	Platinum		Palladium <sup>1</sup>	
	oz. fine	\$	oz. fine	\$		oz. fine	\$	oz. fine	\$
1940.....	108,486	4,240,362	91,522	3,520,746	1945 <sup>2</sup> ....	208,234	8,017,010	458,674	18,671,074

<sup>1</sup> Includes also rhodium, ruthenium, osmium and iridium.  
<sup>2</sup> The 1945 figures include an accumulated revision of previous years.

**Silver.**—Silver, a by-product of most gold and base-metal mines, increased 5 p.c. in quantity in 1949 to 17,641,000 fine oz., including silver bullion and silver contained in concentrates exported. Production of fine silver was about 14,300,000 fine oz. in 1949 and the consumption by Canadian users, other than for coinage, was 6,500,000 fine oz.

Silver mining is not a distinct industry in Canada as the silver-bearing minerals occur in association with other metals of economic value. Most of the metal is obtained from the treatment of base-metal ores although substantial amounts are recovered from gold-quartz ores and from alluvial gold deposits. In 1949, approximately 43 p.c. of Canada's silver came from British Columbia, 18 p.c. from Quebec, 14 p.c. from Ontario, nearly 10 p.c. from Yukon and the Northwest Territories, and about 9 p.c. from Saskatchewan.

### 14.—Quantities and Values of Silver Produced, 1940-49

NOTE.—Figures for the years 1887-1910, inclusive, will be found at p. 361 of the 1933 Year Book; for the years 1911-28 at p. 344 of the 1939 edition; for 1929-39 at p. 334 of the 1946 edition.

Year	Quantity		Value	Year	Quantity		Value
	oz. fine	\$			oz. fine	\$

1948 <sup>1</sup> ....	75-00	8	2,376,754	3,210,107	737,298	1,323,900	6,717,908	1,718,618	25,382
1949 <sup>1</sup> ....	74-25	3	3,250,578	2,562,859	554,266	1,482,009	7,573,506	1,562,730	70,505

<sup>1</sup> Newfoundland production in 1949 amounted to 585,966 oz. fine, and Alberta 11 oz. fine.

**Zinc.**—Zinc production was stepped up considerably in 1949 when recoveries of the metal in all forms were recorded at 283,000 tons compared with 234,000 tons in the previous year. The 1949 output was exceeded only on two previous occasions, in 1942 at 290,000 tons and in 1943 at 305,000 tons. The value of zinc production in 1949 at \$76,372,000 was the highest on record.

The entry of three new mines raised Quebec's output to 64,000 tons as against 48,000 tons in 1948. With the addition of Newfoundland's production of 32,000 tons, the total recoverable zinc in ores from mines in Eastern Canada totalled 96,000 tons for 1949.

In Manitoba and Saskatchewan the output of zinc was maintained at about the 1948 level of 49,000 tons. In British Columbia production advanced to 144,000 tons from 135,000 tons in 1948, and in Yukon the zinc recoverable amounted to 424 tons.

Production of refined zinc in 1949 was close to 203,000 tons, of which about 22 p.c. or 45,000 tons was sold to Canadian users. Exports of refined zinc in 1949 amounted to 168,307 tons, of which 108,068 tons went to the United States and 52,692 tons to the United Kingdom. In the same period shipments of zinc concentrates to all countries totalled 106,688 tons, including 59,298 tons to the United States, 23,069 tons to Belgium and 15,445 tons to the United Kingdom.

## 16.—Quantities and Values of Zinc Produced, 1940-49

NOTE.—Figures for the years 1911-28 are given at p. 347 of the 1939 Year Book; for 1929-39 at p. 335 of the 1946 edition.

Year	Quantity <sup>1</sup>	Value	Average Price per lb.	Year	Quantity <sup>1</sup>	Value	Average Price per lb.

<sup>1</sup> Estimated foreign smelter recoveries and refined zinc produced in Canada.

<sup>2</sup> Includes Newfoundland production amounting to 64,375,235 lb. valued at \$8,527,787.

### Subsection 4.—Production and Consumption of Fuels

Information on the coal reserves of Canada is given at pp. 516-518 of the 1950 Year Book.

**Coal Production.**—In 1949 more coal was produced by Canadian mines than in any other year, the total of 19,120,000 tons being nearly 4 p.c. above that for 1948. Substantial increases were reported for each of the Western Provinces but output in Nova Scotia was down slightly.

### 17.—Coal Production, by Provinces, 1940-49

NOTE.—Figures for the years 1874-1910, inclusive, will be found at p. 419 of the 1911 Year Book; for the years 1911-28 at p. 348 of the 1939 edition; and for 1929-39 at p. 347 of the 1946 edition.

**Coal Consumption.**—The sources of coal consumed in Canada in the years 1939-49 are shown in Table 20 and detailed figures of coal made available for consumption in 1949 are given in Table 21; the difference between the totals of the two tables in the same year is accounted for by the fact that coal received may be held in bond at Canadian ports and not "cleared for consumption" until required, while coal received in previous years may be taken out of bond (cleared for consumption) in a later year. Normally, the coal made available for consumption is greater than the apparent domestic consumption, since coal is landed at Canadian ports and re-exported or ex-warehoused for ships' stores without being taken out of bond but, while remaining in bond at the port, it is available for domestic consumption if required.

Because of strikes at coal mines in the United States, and possibly also because of the effort to conserve holdings of U.S. dollars and to further conversions to the use of oil, the imports of coal into Canada dropped by about one-third in 1949. The amount landed in this country in 1949 was 20,000,000 tons compared with 31,000,000 tons in 1948.

18.—Imports<sup>1</sup> of Anthracite, Bituminous and Lignite Coal, 1940-49

NOTE.—Anthracite dust is included under anthracite coal. Figures for the years 1868-1910, inclusive, will be found at p. 420 of the 1911 Year Book; for the years 1911-28 at p. 349 of the 1939 edition; and for 1929-39 at p. 348 of the 1946 edition.

<sup>1</sup> The sum of Canadian coal mines' sales, colliery consumption, coal supplied to employees and coal used in making coke, etc., less the tonnage of coal exported.

<sup>2</sup> Includes small tonnages from countries other than the United Kingdom and the United States.

<sup>3</sup> Deductions have been made from this column to take account of foreign coal re-exported from Canada and bituminous coal ex-warehoused for ships' stores.

<sup>4</sup> Figures based on estimates of population given at p. 121.

## 21.—Coal Output, Exports, Imports and Coal made available for Consumption in Canada, 1949

NOTE.—For details by provinces, see the Annual Report, "Coal Statistics for Canada".

Grade of Coal	Canadian Coal		Imported Coal <sup>1</sup>	Coal Made Available for Consumption
	Output	Exported

<sup>1</sup> Coal reaching Canadian ports whether or not it is cleared from customs.

<sup>2</sup> Lignite coal included with bituminous.

**Petroleum Production.**—Alberta accounted for 94 p.c. of Canada's production of crude petroleum in 1949. Even though operations were restricted pending outlets to eastern markets, Alberta's wells yielded almost twice as much crude as in 1948—Ontario's output increased in 1949 over 1948 by about 50 p.c. The increase in volume for Canada as a whole was about 73 p.c.

## 22.—Quantities and Values of Crude Petroleum Produced, by Provinces, 1942-49

NOTE.—Figures for the years 1936-41 will be found at p. 476 of the 1948-49 edition of the Year Book.

<sup>1</sup> These figures are compiled on a somewhat different basis from the figure of the Alberta Government given on p. 519.

**Alberta Oil Fields.\***—The 1949 petroleum output from Alberta fields reached the record level of 20,087,418 bbl. which is 9,198,826 bbl. or 84 p.c. more than in the preceding year and 94 p.c. of Canadian production. Value of the 1949 output was \$58,999,936 in terms of revenue to the primary producers—an increase of more than 60 p.c. In other words, 1949 production alone was very nearly equal to the

\* Summarized from the *Alberta Oil Review, 1949*, by S. C. Ballantine, Supervisor of Technical Publications, Government of Alberta. Figures in this review are compiled on a basis different from that used in the compilation of Table 22.

whole Alberta production since its beginning in 1914 until the beginning of the Second World War. This increase was achieved despite increasingly drastic "market allowables" imposed by refineries established in the Prairie Provinces so that deliveries should not exceed the refining capacity of some 60,000 to 65,000 bbl. daily. The interprovincial pipe line (see p. 519) is calculated to overcome this obstacle.

The Leduc field continues to be the most prolific of the Alberta fields. Yielding 372,427 bbl. in its first year (1947) its production for 1949 amounted to 9,688,784 bbl. At the end of 1949 there were 351 wells in the field giving a daily average of 25,454 bbl. as compared with 172 wells averaging 21,326 bbl. at the end of 1948. The apparent falling-off in daily average production per well is explained by curtailment through market allowables.

To the northwest of the Leduc field is the Golden Spike No. 1 well with its amazing thickness of 545 ft. of pay sand and the still more amazing No. 5 brought in late in January, 1950—a two-zone producer with 560 ft. thickness. All the hopes that were based upon initial production from Golden Spike No. 1 have not been realized but this and like successes open up new prospects to the west of the main Leduc field whose potential is rated at some 215,000,000 bbl.

The Redwater field with reserves estimated at 500,000,000 bbl. may yet be a formidable contender for first place. In the first statistical period recorded (October-December, 1948) Redwater produced 36,875 bbl. Its output in the same period a year later was 1,678,010 bbl. and 4,793,491 bbl. for the complete year.

Although during 1949 the venerable Turner Valley field's output continued the shrinkage which set in after 1942, it was, nevertheless, third among Alberta's producing fields. The 1949 output was 4,304,063 bbl. bringing its cumulative total in 35 years to 102,155,970 bbl. It has been estimated that the Turner Valley production from 1949 to 1960 inclusive will be about 31,042,000 bbl. with several millions more for the decade 1960-70.

In October, 1949, discovery of the Normandville well at 6,700 ft. gave rise to new promise of petroleum in the Peace River country, some 210 miles northwest of Edmonton. The well produced 971 bbl. in its first half-month from a 25 ft. thick Devonian limestone, and by the end of the year the Alberta Government had granted oil and gas rights to the extent of some 20,000,000 acres in the Peace River as far north as Hay River.

At the end of 1949 there were 1,219 listed wells in Alberta producing a daily average of 54,606 bbl., compared with 717 wells at the end of 1948, averaging 37,785 bbl. of crude oil daily. The effect of market allowables is reflected in these figures when it is noted that the increase in the number of wells was 72 p.c. while the increase in the quantity of crude delivered was only about 20 p.c. In mid-December it was estimated that with restrictions removed, Alberta fields could produce (at that time) 125,000 bbl. daily. The daily average was then approximately 57,500 bbl. from 1,060 wells. At mid-May, 1950, production was approximately the same from 1,455 wells, a situation that emphasized the need for the construction of the interprovincial pipe line.

During 1949 exploration and development continued at ever-accelerating pace. Of 104 geophysical units in the Prairie Provinces at the end of the year, 85 units were in Alberta, 17 were in Saskatchewan and 2 in Manitoba. Before discovery of the Leduc field early in 1947 there were only 15 such parties in Alberta.

## 23.—Production of Alberta Oil Fields, 1948 and 1949

NOTE.—Figures for total production of petroleum for 1922-46 are given at p. 473 of the 1947 Year Book, and production in the different fields for 1947 at p. 477 of the 1948-49 edition.

<sup>1</sup> Three months.

*The Edmonton-Superior Pipe Line.*\*—Starting at Edmonton, Alta., the pipe line to Superior, Wis., U.S.A., will have a length of 1,150 miles. From the Edmonton terminal the crude flows to Regina, Sask., through a 20-inch pipe line, boosted on the second half of its 450 mile journey by a pumping station at Ermine, Sask. East of Regina other intermediate stations en route to Lakehead are to be at Cromer and Gretna, Man., and at Clearbrook, Minn., U.S.A.

It was the discovery of the Leduc field in February, 1947, and a rapid sequence of events which followed that precipitated the planning of this pipe line, for it was immediately apparent that all estimated reserves of Alberta petroleum would have to be drastically reviewed. These reserves, at the time of the Leduc discovery, were estimated at 35,000,000 bbl. At the end of 1947 the estimate was 150,000,000 bbl., in 1948, 400,000,000 bbl., and in 1949, 830,000,000 bbl.

The line is planned for an initial capacity of 95,000 bbl. per day for the Edmonton-Regina section and 70,000 bbl. per day for the Regina-Superior section. Additional pumping stations are capable of boosting this to 150,000 bbl. per day on the Edmonton-Regina section and 103,000 bbl. on the Regina-Superior, the reduced capacity east of Regina anticipating quantities drawn off there and at possible future refinery sites.

Establishing the easterly terminal at Superior, Wis., does not constitute 'export' of oil to the United States. Superior is simply lakehead for the shipment by tankers of Alberta oil to the refineries at Sarnia, Ont., and thence the refined product to the Ontario markets. During the season of closed navigation stock-piling of crude is provided for at Superior in storaged capacity of some 1,500,000 bbl.

*The Tar Sands and Bituminous Developments.*†—Bituminous sand studies were continued in 1949 at and around the Alberta Government's separation plant at Bitumount, the construction of which was not sufficiently complete for trial operation until late in 1948.

Plant operation revealed the following important facts: the bituminous sand put through during the season contained about 12 p.c. oil by weight. Lower beds contain a higher percentage of oil, but there is no evidence that the feed to the plant will exceed a content of 15 p.c. of oil; primary recovery of wet crude was 90 p.c. containing as little as 4.5 p.c. of mineral to 10 p.c. and more under varying conditions; water content of the crude varied between 25 p.c. and 40 p.c.; the dehydration unit removed the water and reduced the mineral content to less than 3 p.c.

\* Summarized from an address by T. S. Johnston, Vice-President of Interprovincial Pipeline Company, Limited, before the Association of Professional Engineers and the Winnipeg branch, Engineering Institute of Canada, Dec. 15, 1949.

† Condensed from the Annual Report (1949) of the Research Council of Alberta.

Operations to determine the percentage of voids and percentage saturation with oil and water in about 20 ft. of beds gave the following results: specific gravity of the bituminous sand varied between 2.03 and 2.08; a cubic yard of sand in place at the quarry weighs about 3,450 lb.; total voids vary between 33 p.c. and 35.5 p.c. of the volume of undisturbed sand; total saturation of the voids of undisturbed sand with oil and water varies between 86.5 p.c. and 91.5 p.c.; percentage water saturation varies between 72 p.c. and 86 p.c.; only a few analyses have shown a larger oil content than 15.5 p.c.

The amount of oil that can be present is determined by the void space. Bitumount sand appeared richer than sand from the Abasand quarry near McMurray, yet analyses of Abasand samples generally showed oil contents greater than 16 p.c. The sand grains in the Abasand sand are finer than those at Bitumount and the void spaces are about 40 p.c. of the volume of sand.

**Natural Gas Production.**—Alberta accounts for about 85 p.c. of Canada's production of natural gas. It is estimated that the total for all provinces was 60,000,000,000 cu. ft. in 1949, of which 51,000,000,000 cu. ft. was from Alberta's wells. Ontario's production amounted to 8,000,000,000 cu. ft. in 1949.

#### 24.—Quantities and Values of Natural Gas Produced, by Provinces, 1940-49

NOTE.—For the years 1892-1919, see the Annual Report on the Mineral Production of Canada, 1928, p. 188; for the years 1920-28 see p. 347 of the 1940 Canada Year Book; and for 1929-39, p. 350 of the 1946 edition.

<sup>1</sup> Includes small amounts produced in Saskatchewan and the Northwest Territories.

#### Subsection 5.—Production of Non-Metallic Minerals (Excluding Fuels)

The most important minerals in this group are asbestos, gypsum, salt and sulphur, but it also includes numerous other items such as feldspar, graphite, iron oxide, magnesitic dolomite, mica, nepheline syenite, peat moss, silica brick, sodium sulphate, soapstone and talc.

**Asbestos.**—The asbestos produced in Canada is practically all of the chrysotile variety and up to the present has come entirely from the serpentized rock in the Eastern Townships of Quebec. A new mine at Matheson, Ont., began production about the middle of 1950. The value of the annual production of asbestos has increased from less than \$24,700 in 1880 to a peak of \$42,231,475 in 1948 and \$39,746,072 in 1949. Most of the mines were idle for several months of 1949 because of labour disputes and shipments declined 20 p.c.

The world's largest market is in the United States and Canada's proximity to this market is very advantageous to the asbestos industry in this country.

**25.—Quantities and Values of Asbestos Produced, 1940-49**

NOTE.—Figures for the years 1896-1910, inclusive, will be found at p. 424 of the 1911 Year Book; for the years 1911-28 at p. 354 of the 1939 edition; and for 1929-39 at p. 353 of the 1946 edition.

**Gypsum.**—The use of gypsum in the building trades has increased rapidly and Canada has extensive deposits of gypsum favourably situated for commercial developments. Gypsum is exported from Canada in crude form, mainly to the United States, for the manufacture of gypsum products. In 1949 the output of gypsum was 6 p.c. lower in quantity and about 2 p.c. lower in value.

**26.—Gypsum Produced, by Provinces, 1940-49**

NOTE.—Figures for the years 1926-39 are given at p. 321 of the 1943-44 Year Book.

**Salt.**—Salt is obtained from brine wells in the Provinces of Ontario, Manitoba and Alberta, but in Nova Scotia it is recovered by mining rock-salt and by evaporation from brine. Domestic production is sold principally to the dairy, meat-curing and -canning industries, to fisheries, to highways and transport departments, to agriculturists for use as a soil sweetener, to chemical industries, and as table salt. About 50 p.c. of the salt production is used in making caustic soda, soda ash and related chemicals. In 1949, Ontario produced about 80 p.c. of the Canadian total.

**27.—Salt Produced, by Provinces, 1940-49**

<sup>1</sup> Totals for 1949 include 8,103 tons valued at \$144,526 for Saskatchewan.

**Sulphur.**—Sulphur production statistics given in Table 28 represent the quantity and value of sulphur contained in iron pyrites shipped plus the quantity and value of sulphur reclaimed for acid manufacture, etc., from smelter fumes. Output by provinces was: Quebec 88,804 tons valued at \$348,807; Ontario 12,630 tons valued at \$126,300; and British Columbia \$160,437 tons valued at \$1,564,277.

Sulphur is used in Canada chiefly in the production of sulphite pulp, sulphuric acid and rayon. It is used also in the manufacture of explosives, rubber goods, insecticides and matches and in petroleum refining.

## 28.—Quantities and Values of Sulphur Produced, 1940-49

## Subsection 6.—Production of Clay Products and Other Structural Materials

Production of clay products and other structural materials is dependent upon the activity of the construction industry; output in 1949 reached a record value of \$113,903,079. This group includes clay and clay products (brick, drain tile, sewer pipe, etc.), cement, lime, sand, gravel and stone.

## 29.—Values of Clay Products and Other Structural Materials Produced, by Provinces, 1940-49

NOTE.—Figures for the years 1926-39 are given at p. 355 of the 1946 Year Book.

Year	Nova Scotia	New Brunswick	Quebec	Ontario	Manitoba	Saskatchewan	Alberta	British Columbia	Canada
	\$	\$	\$	\$	\$	\$	\$	\$	\$

<sup>1</sup> Includes value of cement containers.

<sup>2</sup> Includes \$1,683,483 for Newfoundland production.

**Clay Products.**—The sales value of clay products produced in Ontario, Quebec, Nova Scotia, New Brunswick and Saskatchewan increased in 1949 as compared with 1948, but decreased in the other provinces. Common clays, suitable for the production of building-bricks and tile are found in all the provinces of Canada, although production is greatest in Ontario and Quebec. Stoneware clays are largely produced from the Eastend and Willows area in Saskatchewan and shipped to

Medicine Hat, Alta., where, utilizing the cheap gas fuel, they are manufactured into stoneware, sewer-pipe, pottery, tableware, etc. Stoneware clay also occurs in Nova Scotia some of which is used for pottery though it has not been developed extensively for ceramic use. Two large plants and a few small plants manufacture fireclay refractories from domestic clay in British Columbia, Saskatchewan and Nova Scotia. Deposits of high-grade, plastic, white burning clays occur in northern Ontario and clay deposits yielding a high-grade of china clay have been found along the Fraser River in British Columbia but these have not been used on a commercial scale. Ball clays of high bond strength occur in the White Mud beds of southern Saskatchewan but have not been developed to any extent.

### 30.—Values (Total Sales) of Clay Products Produced, by Provinces, 1940-49

NOTE.—Figures for the years 1926-39 are given at p. 356 of the 1946 Year Book.

Year	Nova Scotia	New Brunswick	Quebec	Ontario	Manitoba	Saskat- chewan	Alberta	British Columbia	Canada

<sup>1</sup> Includes Newfoundland production valued at \$25,450.

**Cement.**—The production of cement has more than doubled in quantity and almost trebled in value since 1940. The largest production is in Quebec and Ontario although there are active plants in Manitoba, Alberta and British Columbia. The imports of cement have also been relatively high during the past three years.

### 31.—Quantities and Values of Production (Sales), Imports and Exports and Apparent Consumption of Portland Cement, 1940-49

NOTE.—Figures for the years 1910-28 are given at p. 356 of the 1939 Year Book; and for 1929-39 at p. 356 of the 1946 edition.

350 lb.

<sup>2</sup> The barrel of cement equals

**Sand, Gravel and Stone.**—Deposits of sand and gravel are numerous throughout eastern Canada, with the exception of Prince Edward Island where gravels are scarce. The local needs for these materials are usually supplied from the nearest deposits as their cost to the consumer is governed largely by the length of the haul. This accounts for the large number of small pits and the small number of large plants. Every province, except New Brunswick and Prince Edward Island, produces natural bonded sand but some grades particularly suitable for certain industries demand a much higher price than ordinary sand. Quebec and Ontario contributed 68 p.c. of the total quantity of sand and gravel in 1949. The greater part of the output is used in road improvement, concrete works and railway ballast, and most of the commercial plants are equipped for producing crushed gravel, a product that can compete with crushed stone.

The stone industry has two main divisions, stone quarrying and the stone-products industry. The granite, limestone, marble, sandstone and slate quarries of Canada yield high-grade structural and decorative materials and also supply requirements for chemical and other allied industries. The gross value of stone of all varieties produced in Canada in 1949 totalled \$20,528,073 as compared with \$17,949,000 in 1948.

## Section 5.—Industrial Statistics of the Mineral Industries

The scope of the annual statistics on mineral production published by the Dominion Bureau of Statistics includes a general review of the principal mineral industries, such as the copper-gold, silver-lead-zinc, and nickel-copper industries, as well as a section on metallurgical works. Additional data published at irregular intervals include such features as capital employed, numbers of employees, wages and salaries paid and net value of sales.

The figures for 'net income from sales' of industries given in Tables 33 and 34 are those reported by the operators and are, in each case, the settlements received for shipments by producers and the additional values obtained when the smelting of ores is completed in Canada. The totals indicate more nearly the actual returns to the different industries than do the values for the minerals in Table 2 of this Chapter where, in the case of copper, lead, zinc and silver, the values are computed by applying the average prices for the year in the principal metal markets to the total production from mines and smelters with no reduction for fuel, electricity and other supplies consumed in the production process. Some imported ores and concentrates are treated in Canadian non-ferrous smelting and refining works, especially in the production of aluminum, where imported ore only is used, and of cobalt which came mainly from African ores. The net sales of these plants include, therefore, the net value of the metals recovered from these imported ores and, to this extent, the net sales shown in Tables 33 and 34 include products of other than Canadian origin.

**33.—Principal Statistics of the Mineral Industries, by Provinces, 1948**

<sup>1</sup> Includes freight and smelter charges and cost of ores treated.

A summary of the industrial statistics of the principal mineral industries operating in Canada in the years 1944-48 is presented in Table 34. The difficulties imposed by the War in the way of labour shortages, lack of new equipment and essential supplies necessary for the mines, resulted in a steady drop in the gross value of production for the entire auriferous quartz mining industry. The gross value of recoverable metals, gold, silver, etc., in the quartz mining industry, which was \$179,000,000 in 1941, fell steadily to \$86,000,000 in 1945 but increased to \$108,000,000 in 1948.

## Section 6.—World Production of Metallic Minerals and Fuels

World production figures are available only for a limited number of metals and fuels. These are presented in summary form for 1948 in Table 35.

### 35.—World Production of Certain Metallic Minerals and Fuels, 1948

Sources: Gold and silver figures are from the Annual Report of the Director of the United States Mint; all other figures are from the United Nations Statistical Year Book, 1948, and are preliminary figures converted from thousand metric tons to short tons.

## Section 1.—Water-Power Resources\*

Canada, a land of many lakes and rivers, has been abundantly endowed by nature with great water-power resources which are well distributed across the country. In most sections, adequate precipitation and favourable topography result in numerous rivers on which falls and rapids frequently occur and offer excellent opportunities for the development of hydraulic power; with the exception of the prairies of the middle west, water-power resources of importance are found in virtually every part of the country. In British Columbia, where precipitation is high, the rivers flowing down the Pacific slope of the Rocky Mountains offer many fine power sites. Alberta, although a Prairie Province, also has mountain streams from the Rockies as well as great reserves of undeveloped power on its large northern rivers. The great Canadian Shield of Precambrian rock, which forms an arc around Hudson Bay, covers part of the Northwest Territories and northern Saskatchewan as well as a large part of Manitoba, Ontario and Quebec; it is a rough, forest-covered, well-watered area characterized by innumerable lakes and fast-flowing rivers with many falls and rapids. The power of the Great Lakes-St. Lawrence River System forms part of the great resources of Ontario and Quebec upon which their status as the principal manufacturing provinces of Canada is built and which compensates in large degree for the lack of indigenous coal. In the Maritimes, the precipitation is moderately heavy and the rivers, while not large, afford numerous possibilities for power developments of moderate size. The water powers of the Province of Newfoundland have an estimated potential of over 5,000,000 h.p. of which in 1949 about 5 p.c. had been developed.

### Subsection 1.—Water-Power Resources of Canada and Other Countries

Comparison between the water-power resources of Canada and those of other countries is rendered difficult by incomplete world statistics and differing bases of tabulation; only crude estimates of potential power are possible for many countries where resources are largely unexplored.

\* Revised under the direction of Major-General H. A. Young, Deputy Minister, Department of Resources and Development, by Norman Marr, Chief, Water Resources Division.

## POTENTIAL AND INSTALLED WATER POWER IN CANADA

The potential resources of the combined continents of Africa and Asia represent more than 64 p.c. of the world total, whereas the total development that has been made in these two continents is only slightly more than 14 p.c. of the development in the world at large. Enormous potential resources exist on the great river systems of Africa and Asia but much of this potential power is located in the remote areas of non-industrial countries and is without present prospective markets; it is thus of little economic interest. This also applies to substantial resources that exist in parts of South America and Oceania.

Table 1 compares the developed and potential resources of the continents of the world and also of those countries in which the development and utilization of water-power resources has progressed to a considerable extent.

<sup>1</sup> Figures from Geological Survey of the United States Department of the Interior.

Table 1 shows that Canada, among countries of the world, ranks second in developed power, being exceeded only by the United States. In potential power, Canada stands in fourth place among the countries listed; however, Canada's reserves of undeveloped power are on the whole more readily available to prospective markets than is the case in either the Union of Soviet Socialist Republics or India. Marketable potential power in Canada, in 1949, was outranked only by that of the United States.

In comparing the estimates of potential power with those of developed power, and in estimating the proportion of a nation's water-power resources already developed, it should be noted that, at fully developed sites, the installed capacities are usually two or three times the size of the ordinary-minimum-flow potential power of the same sites. For example, it is estimated that, under present hydraulic practice, the water-power resources of Canada would allow an economic turbine installation of over 55,000,000 h.p. and that only about 21 p.c. of the presently recorded resources has been developed.

Additional information regarding Canada's water-power resources is included in the 1940 Canada Year Book, pp. 353-364. An earlier comparison is made with the resources of other countries and an extensive review is given of problems connected with the development, distribution and merchandising of power in Canada.

### Subsection 2.—Development and Growth of Water Power in Canada

Although extensive utilization at present is being made of Canada's water-power resources, there are large reserves still available for development. The greater part of this undeveloped power lies in the more remote parts but a number of sites within economic transmission distance of existing centres of population have not been exploited as yet and existing power reserves not too distant should be sufficient to meet the prospective demand for some years at least.

The development from year to year of Canada's water-power resources is a good index of the country's industrial growth and of the change in its economic life since the beginning of the present century. In 1900, prior to the inception of long-distance transmission of electricity, Canada's economy was based largely on agriculture and the total of hydraulic installations, mostly small mills, was only 173,000 h.p. With the successful solution of the problems of transmission of electrical energy for use in distant communities, the development of large hydraulic projects became practicable and, by 1910, total installation had risen to 977,000 h.p. In ensuing decades, the growth in installed capacity, partly speeded by war demands, proceeded at an accelerated rate so that by 1920 the total was 2,515,000 h.p.; by 1930, 6,125,000 h.p.; by 1940, 8,584,000 h.p.; and by the end of 1949, installed capacity had reached 11,613,333 h.p. including capacity in the Province of Newfoundland of 262,050 h.p. Continued rapid growth during the next several years is indicated by plants now under construction or planned.

The availability of large amounts of hydro-electric energy from water-power developments has so fostered the economic utilization of the natural products from land, mine and forest, that Canada has become highly industrialized and is now one of the more important manufacturing countries. Low-cost power from Canada's rivers is fundamental in meeting the enormous demands of its largest industry, pulp and paper manufacturing, which ranks as one of the world's great industrial enterprises; it also allows the economic mining, milling and refining of base and precious metals and facilitates their fabrication into a multitude of manufactured articles. The great hydro-electric undertakings, built to meet the domestic and industrial requirements of the country, were of incalculable value to Canada's participation in two world wars, particularly in the Second World War. Between 1939 and 1945, approximately 2,000,000 h.p. was added to water-power capacity, all of which was used for war production; great quantities of power were also diverted from normal to war purposes; this allowed Canada to produce materials and munitions of war on a very large scale proportionate to population.

From hydro-electric developments ranging in size from a few hundred to more than 1,000,000 h.p., networks of transmission lines carry power not only to most urban centres of Canada but also in increasing degree to the rural areas of the country. The wide distribution of power has facilitated the decentralization of industry in that manufacturing processes covering such items as foods, textiles and forest products are carried out in many of the smaller centres of population. Low-cost hydro-electricity has also contributed to a high standard of living in Canada. Economical domestic service is supplied and is being extended rapidly to homes in many rural communities and farms, as well as to those in most towns and cities.

With a total capacity of 11,613,333 h.p., present water-power plants in Canada, if operated at full load, would produce energy at a rate corresponding to the output of more than 116,000,000 manual workers, on the commonly accepted basis of one mechanical horse-power equalling the working capacity of ten men.

# WATER POWERS OF CANADA

Scale of Miles  
0 100 200 300

Table 2 presents a summary of the water-power resources of Canada according to the records of the Dominion Water and Power Bureau as at Dec. 31, 1949. In the case of developed power, the figures for 1948 are listed for comparative purposes.

## 2.—Available and Developed Water Power, by Provinces, 1948 and 1949

Province or Territory	Available 24-Hour Power at 80 p.c. Efficiency, December, 1949		Turbine Installation

Alberta.....	507,800	1,258,000	106,560	107,225
British Columbia.....	7,023,000	10,998,000	1,009,769	1,238,069
Yukon and Northwest Territories.....	382,500	814,000	28,069	28,469
<b>Canada.....</b>	<b>26,914,500</b>	<b>42,899,000</b>	<b>10,870,718</b>	<b>11,613,333</b>

The figures listed in the first and second columns of Table 2 represent 24-hour power and are based upon rapids, falls and power sites of which the actual drop, or the head possible of concentration, has been measured or at least carefully estimated. Many unrecorded rapids and falls of undetermined power capacity exist on rivers and streams from coast to coast (particularly in the less-explored northern districts); these will become available for tabulation only as more detailed survey work is completed. Unless definite studies have been carried out and the results made matters of record, no consideration has been given to the power concentrations that are feasible on rivers and streams of gradual gradient, where economic heads possibly may be created by the construction of power dams. Thus, with regard to possible sites, the listed figures of available power (under two conditions of stream flow) represent only the *minimum water-power possibilities of Canada*.

The third and fourth columns give the total capacity of the water wheels actually installed; these figures should not be placed in direct comparison with those in the first and second columns to deduce the percentage of the available water-power resources developed. At developed sites, the water-wheel installation averages 30 p.c. greater than the corresponding calculated maximum available power figures included in the second column and covering the same sites. The above figures, therefore, indicate that the *at present recorded water-power resources* will permit of a turbine installation of more than 55,000,000 h.p.; also, that the turbine installation at Dec. 31, 1949, represents roughly only 21 p.c. of recorded water-power resources.

Table 3 shows clearly the consistent growth in capacity since the beginning of the century and the heavy increase in installation during the war years 1942 and 1943. During 1949 as a result of the great post-war activity in hydro-electric construction, more than 480,000 h.p. was added to the total capacity of the country; many other new plants and additions are under construction.

### 3.—Hydraulic Turbine Horse-Power Installed by Provinces, as at Dec 31, 1940-49

NOTE.—Figures for 1900-30 are given at p. 361 of the 1939 Year Book; for 1931-39 at p. 362 of the 1946 edition.

British Columbia.....	1,045,812	135,500	56,757	1,238,069
Yukon and Northwest Territories.....	8,750	—	19,719	28,469
<b>Canada.....</b>	<b>10,448,449</b>	<b>883,191</b>	<b>281,693</b>	<b>11,613,333</b>
Percentages of total installation.....	90.0	7.6	2.4	100.0

<sup>1</sup> Includes only hydro-electric stations that develop power for sale. <sup>2</sup> Includes only water power actually developed by pulp and paper companies. <sup>3</sup> Includes only water power actually developed by industries other than central electric stations and the pulp and paper industries. <sup>4</sup> All water wheels and hydraulic turbines installed in Canada.

It may be noted that central electric station classification totalling 10,448,449 h.p. represents 90 p.c. of the total developed water power as at Dec. 31, 1949. In 1900 the corresponding percentage was 33.5, thus showing the tremendous growth in the central electric station industry since the inception of successful long-distance transmission of electricity. Central hydro-electric stations produced nearly 97 p.c. of all electricity sold in or exported from Canada during 1949.

The pulp and paper turbine installation total of 883,191 h.p. shown in Table 4 includes only water power *actually developed* and directly used by pulp and paper companies. In addition, this industry is the greatest purchaser of central electric station power, buying about 23 p.c. of all power sold for industrial purposes. Part of the purchased power is classed as secondary, being used for steam generation by electric boilers.

The 'other industries' group of Table 4, column 3, develops 281,693 h.p. solely for its own use. These diversified industries also provide a broad market for the power sold by the central electric stations.

The figure of total hydraulic installation in Canada, 11,613,333 h.p., is the cumulative total of installation for all water wheels and hydraulic turbines. It has been adjusted to Dec. 31, 1949, by the addition of any installations made during the year even though this equipment may not be in use; adjustments are also made covering turbines or water wheels that have been removed. Somewhat similar figures are reported by the annual Census of Industry: these differ slightly since they are compiled on a different basis and represent only the sum of the installations in the plants actually in operation during the year being reported by the Census, not total installation.

### Subsection 3.—Water-Power Developments in the Provinces and Territories, 1949

During 1949, the post-war boom in hydro-electric construction continued without abatement, and excellent progress was achieved owing to relatively favourable conditions with respect to both labour and materials. New water-power installations brought into operation totalled 480,565 h.p., principally comprised of new units added to existing stations. A number of large developments that were in an advanced stage of construction were expected to add about 1,500,000 h.p. during the years 1950 and 1951, while other projects were in the preliminary phases of construction or were definitely planned. The demand for hydro-electric energy continued to grow during 1949, primary power consumption being up 3.1 p.c. At certain times some of the large systems had difficulty in meeting the full demand owing to generally unfavourable stream-flow conditions. Overall progress in each province is outlined below.

*Atlantic Provinces.\**—In the Eastern Provinces a number of projects were active or planned. The Newfoundland Light and Power Company had under construction for operation in 1950 a new development of 13,000 h.p. on the Mobile River and had on order a new unit of 3,350 h.p. for the Tors Cove plant. The

\* In addition to water-power development, the construction of steam-electric plants proceeded actively with the Canada Electric Company, Limited, completing an addition of 15,000 kw. in its plant at Maccan, N.S., and the following being under way: Nova Scotia Power Commission, Trenton, 7,500 kw.; Nova Scotia Light and Power Company, Limited, Halifax, 20,000 kw.; Seaboard Power Corporation, Sydney, 18,750 kw.; Maritime Electric Company, Limited, Charlottetown, P.E.I., 7,500 kw.

Nova Scotia Light and Power Company installed a new unit of 4,500 h.p. in its Black River Plant and had under way for 1950 operation a development of 5,000 h.p. on Paradise Brook. The Nova Scotia Power Commission had under advanced construction a development of 12,000 h.p. on the Mersey River at Deep Brook and was contemplating the development of 8,000 h.p. on the Bear River and 4,800 h.p. on the Tusket River. The New Brunswick Electric Power Commission was investigating several water-power sites including the Magaguadavic River, 16,000 h.p., the Tobique River, 6,000 h.p., and the St. John River at Beechwood.

*Quebec.*—In Quebec, the Shawinigan Water and Power Company completed its development of 195,000 h.p. at Shawinigan Falls on the St. Maurice River by bringing into operation the second and third units each of 65,000 h.p. The Company also had under way a new development of 390,000 h.p. at La Trenche Rapids on the upper St. Maurice River, flow diversion having been completed in 1949; initial operation is expected in 1951. The Quebec Hydro-Electric Commission is building a new power-house at Beauharnois, St. Lawrence River, which will ultimately contain 11 units of 55,000 h.p. each, the first three units being scheduled for 1951 operation. In its Rapid VII Ottawa River Plant, the Commission completed the installation of a fourth unit of 16,000 h.p. Further down river, field surveys were conducted for a development at Rapid I. The Gatineau Power Company brought into service the third and final unit of 27,000 h.p. in its Bryson Plant on the Ottawa River, following completion of the regulating dam on the Rocher Fendu Channel. The Northern Quebec Power Company increased the capacity of its Quinze River Plant by 10,000 h.p. by raising the dam by 20 feet; the plant contained four units each of 12,500 h.p. and a fifth unit of 34,500 h.p. is under installation for 1950 operation. Ogilvie Flour Mills Company, Limited, added two new units of 1,600 h.p. each in its plant on the Lachine Canal and the Municipality of Jonquière completed a new development of 4,200 h.p. on the Au Sable River. Plant extensions under construction included: Electricité de Mont Laurier, Lièvre River, 2,700 h.p.; Pembroke Electric Light Company at Waltham, Black River, 3,000 h.p.; city of Rivière du Loup, on the Rivière du Loup, 1,800 h.p.

*Ontario.*—In Ontario, only a minor increase in installed capacity was reported in 1949, being 2,300 h.p. at the Upper Falls, Montreal River Plant of the Great Lakes Power Company, due to increased head following raising of the dam. However, the Hydro-Electric Power Commission of Ontario\* had a tremendous program of construction actively under way with good progress reported on all projects. At Des Joachims, on the Ottawa River above Pembroke, the closure of the main dam was effected in September, 1949, construction of the power-house, penstocks and turbines was well advanced and tailrace excavation was under way; three units of 60,000 h.p. each are expected to be in operation late in 1950 and the remaining five units in 1951. At the Chenaux Development, Ottawa River, north of Renfrew, dam construction was nearing completion at the end of 1949 and power-house construction was under way; two of the eight units to be installed, each of 20,000 h.p., are scheduled for 1950 operation and the remainder for 1951. A third Ottawa River site, at La Cave Rapids above Mattawa, came under construction in 1949, the cofferdam and diversion channel being completed at the year's end and excavation for the main dam well advanced; there will be six units of 32,000 h.p. each and it

\* In addition to its water-power projects, the Commission is constructing for 1951 operation two large auxiliary steam plants, one of 120,000 kw. (ultimately 240,000 kw.) at Windsor and one initially of 200,000 kw. at Toronto; pending completion of these plants, five emergency steam-electric generating stations totalling 61,000 kw. were put into operation in the Southern Ontario System late in 1949.

is anticipated that the first unit will come into operation in 1952. On the Nipigon River at Pine Portage, an initial development of 80,000 h.p. in two units was nearing completion with operation expected in the summer of 1950; provision has been made for two additional units when required. At the Tunnel Site, on the Mississagi River, near Thessalon, the high dam and the power-house (to contain two units each of 28,000 h.p.) are well advanced and operation of the plant is expected by mid-summer of 1950; a storage dam also was being constructed upstream at Rocky Island Lake. Aside from the Commission's operations, the Great Lakes Power Company is adding a 13,200-h.p. unit in its Michipicoten River plant for 1950 operation and the town of Orillia has under construction a development of 3,750 h.p. on the Muskoka River.

*The Prairie Provinces.\**—In Manitoba, the Winnipeg Electric Company increased the capacity of its Seven Sisters Plant, Winnipeg River, by 54,000 h.p. due to raising of the head to 66 feet and to the installation of a new unit; the power-house contained four units of 37,500 h.p. each, with the fifth unit under installation for 1950 operation and with space allowance for the ultimate installation of a sixth unit. The Manitoba Government began the development of 114,000 h.p. at Pine Falls on the Winnipeg River, with cofferdam construction being well advanced at the end of 1949; initial operation of the first two units of 19,000 h.p. each is scheduled for late in 1951. Sherritt-Gordon Mines, Limited, is planning the development of about 7,000 h.p. on the Laurie River, a tributary of the Churchill River, about 44 miles from the Lynn Lake mining field. In Alberta, only one new hydro-electric unit was brought into operation in 1949, that being a Pelton wheel of 665 h.p. by Northern Utilities, Limited, at Jasper, Alta. Under construction, however, is a development of 62,000 h.p. by Calgary Power, Limited, at Spray Lakes in the upper Bow River basin; good progress was made and initial operation is scheduled for October, 1950.

*British Columbia.*—In British Columbia, a total of 228,300 h.p. of new hydraulic capacity was brought into operation during 1949. The largest individual addition was that of 124,000 h.p. in two units in the Bridge River plant of the British Columbia Electric Railway Company, Limited, which brought the total plant capacity to 186,000 h.p.; ultimately this plant may contain 10 units; water storage is provided by the upstream LaJoie dam, which is practically completed. The Company also had under way installation of a third unit of 47,000 h.p. in its Ruskin plant on the Stave River and is investigating a high-head site of about 70,000 h.p. at Jones Lake, 75 miles east of Vancouver. The British Columbia Power Commission completed its John Hart Development, Campbell River, Vancouver Island, to the stage of 112,000 h.p. by installing the third and fourth units of 28,000 h.p. each and by finishing the Ladore Falls storage dam; the planned ultimate capacity of the plant is 168,000 h.p. in six units. Good progress has been achieved on the Commission's Whatshan Lake project in the south-central part of the Province and the first two units (four ultimately) of 16,500 h.p. each are expected to be in operation in 1950. The Consolidated Mining and Smelting Company of Canada, Limited, completed the installation of a third 37,000-h.p. turbine in its Brilliant plant, Kootenay River. Other additions to capacity include: city of Nelson,

\* In addition to the above water-power developments fuel-power electrical generating capacity was increased by 6,000 kw. at Flin Flon, Man., and by an enlargement of the plant at Churchill, Man. The Saskatchewan Power Corporation added to the Provincial system two new diesel units of 1,600 h.p. each, at Watrous and at Yorkton, Sask. The capacity of the steam plant of the city of Edmonton, Alta., was increased by 30,000 kw. and that of Canadian Utilities at Vermilion, Alta. by 4,200 kw.

Kootenay River, 6,750 h.p.; British Columbia Pulp and Paper Company, 3,650 h.p. at Woodfibre and 1,200 h.p. at Port Alice (a replacement of a 300-h.p. unit). Investigations were continued by the Aluminum Company of Canada toward the establishment of a high-head plant of large capacity on one of the coastal inlets.

*Yukon and the Northwest Territories.*—In Yukon, a development of 400 h.p. was brought into operation on Porter Creek, near Whitehorse, by the Yukon Electrical Company, Limited, which serves Whitehorse and vicinity. Investigations covering a possible development on the Mayo River to serve the silver-lead mines in the vicinity were conducted by the Government of Canada during 1949.

Parliament has provided \$500,000 in 1950-51 for the Commission to commence construction of a hydro-electric power development in Mayo River Canyon in Yukon. The project will consist of a 1,200 ft. hydraulic tunnel leading to a power-house where the generating equipment will operate under a head of 120 ft. The initial installation will provide 3,000 h.p. but essential provision will be made for raising this power output to the maximum of 8,000 h.p. A 27 mile transmission line is planned from the power-house to the region of the silver-lead mines near Galena and Keno Hills. The initial installation together with the transmission line will cost approximately \$3,000,000.

Early in July, 1950, a start was made on the construction of a transmission line 9,000 ft. long, from the Commission's terminal sub-station near Yellowknife, to the Akaitcho Yellowknife Gold Mines, Limited, property. The estimated cost including terminal and protective equipment is \$27,000.

#### CONVERSION PROGRAM TO 60-CYCLE POWER IN SOUTHERN ONTARIO\*

In addition to the tremendous post-war power development program, which, by 1952, will bring into service new resources totalling approximately 1,600,000 h.p., the Hydro-Electric Power Commission of Ontario is engaged upon a vast long-term program of frequency standardization at 60 cycles in the southern areas of the Province. Affected by the plan are the Commission's 25-cycle stations and distribution facilities, the plants of some 150 Hydro municipalities and the frequency-sensitive equipment and appliances of approximately 800,000 electrical consumers—industrial, commercial, farm and domestic. It is estimated that this change-over will take between 10 to 12 years to complete. No such large-scale change-over, conceived as one co-ordinated plan to be carried out in orderly sequence without a break, has been recorded elsewhere in the world. Its cost is estimated at \$200,000,000.

**Origin of 25-Cycle Frequency.**—Twenty-five-cycle frequency in some parts of Ontario, like 60-cycle frequency in others, was an inheritance of the Commission. In the Niagara area, it was the frequency of the initial power purchased for distribution to the original group of Hydro municipalities in Ontario. For years there was no pressing demand for a change, and it was not until comparatively recently that the phrase "a 25-cycle island in a 60-cycle sea" was coined to describe that part of southern Ontario lying west of the city of Oshawa and extending to the

\* Prepared under the direction of Robert H. Saunders, C.B.E., K.C., Chairman of the Hydro-Electric Power Commission of Ontario.

This diagram shows the Southern 'island' of 25-cycle power surrounded on all sides by 60-cycle areas. This highly industrialized area, as described in the text, is now being converted to 60-cycle frequency by the Ontario Hydro-Electric Commission.

Detroit River. It was an apt description. The Commission's own Georgian Bay Division to the north and its Eastern Ontario Division to the east, with Quebec just beyond, are 60-cycle areas. To the south lies New York State, in which, after many experiments, 60-cycle power predominates. To the west, across the Detroit River from Windsor, the millions of consumers in Michigan are provided with electrical services at the 60-cycle frequency.

In 1917 the Commission acquired the 160,000 h.p. generating station of the Ontario Power Company at Niagara and in 1922 took over its companion development, the 145,000 h.p. station of the Toronto Power Company. Both these stations were generating power at 25 cycles and before their purchase the question had arisen as to what frequency should be installed at the Commission's new 500,000 h.p. Queenston development.

The decision to bring in Queenston at 25 cycles was made because it was considered impossible to carry out a satisfactory change-over program at the time. Unless the other stations at Niagara were brought into line and a practically complete consumer standardization effected, the installation of 60-cycle generation at Queenston would, it was felt, create conflicting zones of different frequencies in the same power division—a formidable barrier to power distribution. Engaged in a costly new power development, and with other important projects in the blue-print stage, the Commission was not in a position to undertake the extensive program demanded and there was no guarantee that it would be able to do so at an approximate future period.

As the Commission extended its power development activities and more and more municipalities joined the Hydro family, it became apparent that standardization of frequency, apart from other benefits, would be of very decided advantage in a grid-system whose development envisaged a common power pool with facilities for the interchange of power between widely separated districts.

During the period between 1926 and 1931, when the Chats Falls development on the Ottawa River was under construction and the Commission was entering into contracts with Quebec producers for additional power, frequency standardization was again debated. For similar reasons to those which had hitherto influenced the Commission, it was decided not to proceed with the project, and arrangements were made for the supply of the new power at 25 cycles. Later, in 1935, a frequency-changer station was erected at the 230,000 h.p. Chats Falls plant. Owned jointly by the Commission and the Ottawa Valley Power Company, the entire output of this plant was available to Ontario Hydro, and the frequency-changer facilities enabled the Commission to increase the supply of 60-cycle power to its Eastern Ontario Division.

During the protracted period of industrial depression which continued, with minor improvements in the situation, up to the beginning of the Second World War, the question of frequency standardization was necessarily relegated to the background. The falling-off in the demand for power affected Hydro contingency and other reserves and proved a deterrent to any consideration of the project. It was not until after the War that the Commission was in a position to entertain it seriously.

**Advantages of Standardization.**—After the War, the increasing demand for power and the many new uses to which it was being put both by industry and domestic consumers emphasized as never before the benefits that would accrue to consumers through frequency standardization. Modern electrical equipment for industrial plants and factories throughout North America, including fluorescent lighting, was normally manufactured for operation at 60-cycles. Turning out 25-cycle equipment was becoming more and more a special job. In many instances improvisations had to be carried out at factories using this lower frequency. Moreover, new household appliances and inventions in the electronic field were mostly adapted for 60-cycle power.

Further emphasizing the need for a change was the Commission's grid-system for which the physical structure had been created in 1944 through combining the former Georgian Bay, Eastern Ontario and Niagara systems, into one Southern Ontario System, while preserving their separate identities as "divisions". For several years there had been an interchange of power between the Niagara system and the Georgian Bay system through a frequency-changer station at Hanover, Ont. With the rapidly increasing demand for electricity, however, it was readily apparent that frequency-changer stations could only be a temporary expedient if consumers in southern Ontario, as populations increased and industry expanded, were to be assured of an adequate common power pool upon which they could draw at need. Standardization would also facilitate interchange of power with Quebec and adjacent areas of the United States.

**Preparatory Planning, Organization and Construction.**—All these considerations weighted the scales in favour of frequency standardization, but it was necessary to study with great care both the engineering problems and the cost factors involved. Nearly two years were devoted to investigation before active

work was started and technical advice was sought from international as well as national sources. When studies were completed and the program decided upon, the plans were presented to the Hydro municipalities so that any modifications could be made which were not out of line with the general scheme.

With regard to the apportioning of costs, it was decided that the Commission would bear the expense of the change-over both with regard to its own system and the frequency-sensitive equipment and appliances of domestic and commercial consumers. Industrial consumers were asked to contribute on an equitable basis to the cost of the change-over of their own electrical equipment. The 25-cycle municipalities were called upon to meet the cost of the change-over of their own sub-station and distribution systems. Part of the cost incurred would be shared by the 60-cycle municipalities in southern Ontario which, it was apparent, would all derive substantial benefits from standardization.

Legislation was approved and passed by the Provincial Government and the Commission was ready to proceed with the special organization required for the successful carrying out of the project. Ontario Hydro was now faced with the most tremendous and complicated task in its history. Water-power developments, through 40 years of experience, had become more or less of a routine business for the Commission's engineers, but there was no guiding precedent for a frequency-standardization program of this magnitude.

First of all, it was necessary to create a new Division of the Commission to which the name "Frequency Standardization" was applied. A close liaison was immediately established with the System Planning Department and the Electrical Engineering Department, the latter being made responsible for the changing of the facilities regulating the supply and distribution of power to the different areas during the progress of the program.

The Commission had already established a Service Centre and was erecting a new transformer station on 200 acres of ground on the western fringe of Toronto, just south of the suburban village of Islington. On this land, two large buildings were constructed to house equipment and supplies for the frequency-standardization program and a third building was planned. Railway sidings and an impressive fleet of trucks provided the facilities for quick handling and dispatch. Garages, work shops and repair shops were alike available for the new project and the tremendous programs of power development and system extension and improvement upon which the Commission was engaged.

As frequency standardization would be a long-term project, it was realized that for a considerable period an ample supply of 25-cycle power would be required for areas awaiting standardization. It was decided therefore not to make any immediate change in the equipment of the existing stations at Niagara, especially as 60-cycle power from the 480,000 h.p. Des Joachims development on the Ottawa River would soon be available. The plants of the Hydro municipalities undergoing the change-over were scheduled to keep pace with consumer requirements, while provision was made for the further regulation of power supply through frequency-changer sets at Scarborough, near Toronto and at Westminster, near London.

It was decided to carry out the standardization program in an area sequence determined by the availability of a permanent supply of 60-cycle power. The first location where 60-cycle power was available was in the Scarborough district east of

Toronto where recently erected frequency-changer units, with a total capacity of 50,000 kva., connected the 25-cycle Niagara division with the 60-cycle Georgian Bay and Eastern Ontario divisions.

In order to test out the program, a "practice zone" was first set up in east York in May, 1949. As many consumers as it was deemed advisable to supply through a 6,000 kva. transformer and 26.4 kv. transmission line were listed and their names turned over to the Commission's contractors. The rapidity and smoothness with which the change-over of equipment and consumer appliances was effected appeared to warrant the conclusion that the program could be carried through to completion in from 10 to 12 years instead of the 15 to 20 years originally predicted.

**Progress of the Change-over Program.**—The Commission prepared to proceed with the program in accordance with an area-sequence policy. A start was made in Scarborough Township in October, 1949. It marked the beginning of the change-over in an area designated by the letter 'A', which, skirting the city of Toronto on the east, follows North Yonge Street to Lake Simcoe, taking in the contiguous municipalities and rural districts. Thus began the detailed work of recording and checking all frequency-sensitive appliances. Technicians of the contracting companies had to cover every house and building in detail and list the exact requirements, a tremendous task in itself but one that held promise of special benefit for every family and interest in the community. The change-over in Area 'A' is expected to be completed in the early spring of 1951.

In January, 1950, frequency standardization began in the Sarnia district (Area B) and in the following June in the London district (Area C). The change-over in these two areas is also expected to be completed in 1951.

Altogether, there are 23 areas to be changed over. Work in the highly industrialized areas will naturally take considerable time to complete and will have to fit in with the availability of 60-cycle power. Standardization in the Windsor district has been placed well forward in the program, with the schedule tentatively set for 1952-54. The change-over in the city of Toronto is expected to take about six years to complete—from 1953 through 1959. Work in Hamilton is scheduled to start in 1955 and finish in 1957. The Kitchener-Waterloo district program is planned for 1952-54 and the Brantford area for 1956-57. The Niagara-Welland peninsula, with its paper mills and chemical plants, will be brought in last of all: here standardization, according to present plans, will start in the district immediately southwest of Hamilton in 1956, and the program will finish in the Niagara Falls area in 1960.

When the program is completed, approximately 300 distributing stations and 30 transformer stations, including such large stations as Burlington and Leaside, will have been changed over on the Commission's Southern Ontario System. To this must be added the conversion of frequency-sensitive equipment in the 150 municipalities enumerated in the program, including 50 municipalities that own their own step-down transformer stations.

About 1,800,000 motors, ranging from midget size to giant type, were enumerated in preliminary consumer inventories. These included the motors for 550,000 washing machines, 300,000 electric refrigerators, 400,000 electric clocks and 100,000 furnace blowers and a miscellany of motors for other less commonly used appliances. In addition there were 167,000 motors associated with industrial machinery and 185,000 commercial motors.

**The New 60-Cycle Power System.**—Ontario Hydro's tremendous post-war power program being carried out at a cost of approximately \$605,000,000 is being closely fitted to the frequency-standardization program. As part of the post-war construction program a 75,000 h.p. addition to the DeCew Falls station near St. Catharines was brought into service at 25 cycles in the autumn of 1947; but as soon as it was decided to proceed with the frequency change-over, preparations were made to supply all generating stations in process of construction with 60-cycle equipment. This decision was made applicable to power projects in northern as well as in southern Ontario.

The Thunder Bay district, containing the lakehead cities of Fort William and Port Arthur, many richly mineralized areas and an impressive concentration of pulp and paper mills, have always enjoyed a uniform 60-cycle system, and no frequency question had to be considered there in the carrying out of the Commission's post-war program. On the other hand, northeastern Ontario, like southern Ontario and for much the same reasons had developed as a dual-frequency territory. There were good grounds however, for the decision to bring in new power under the present development program at 60 cycles.

While in northeastern Ontario there had been a post-war increase in the demand for power at both 25 cycles and 60 cycles, such rapidly growing 60-cycle urban centres as Sudbury and North Bay, with their surrounding rural areas, had to be considered, while the electrical requirements of Timmins and other 25-cycle municipalities were being adequately looked after by power supplied by the 248,000 h.p. Abitibi development and other 25-cycle generating stations. Above all, as an influencing factor, there was the over-all picture, with an interchange of power between northeastern and southern Ontario in contemplation.

**Potential Tie-Ins.**—Facilities will soon be provided for this interchange of power. During 1950 the Commission was engaged on a 192,000 h.p. project at La Cave on the Ottawa River about five miles upstream from the town of Mattawa. This development is scheduled for initial service late in 1951. Already the site is connected with the great Des Joachims development some 65 miles to the southeast by a 230,000-volt transmission line, while communication with Sudbury via Crystal Falls and North Bay was afforded by another 115,000-volt line completed for service in the late autumn of 1950. These connections with the 230,000-volt line from Des Joachims to La Cave, operating temporarily at 115,000 volts, provide for the interchange of limited power loads between northern and southern Ontario pending the bringing into service of La Cave.

In June, 1950, the Commission's 56,500 h.p. Tunnel station on the Mississagi River was brought into service to supplement 60-cycle power supply in northern Ontario. There are three other potential power sites on the Mississagi River, from which an estimated additional 107,000 h.p. can be obtained. Electrical consumers in northern Ontario, however, will not have to wait for more power until development at these sites can be carried out. La Cave will further reinforce the power from Tunnel, and at the same time help to meet increased demands in the south through the transmission via Des Joachims. Through a recently constructed frequency-changer station at Sudbury, it will be possible to utilize some of this 60-cycle power, wherever the need arises, in the northern 25-cycle areas.

The Thunder Bay district is at present isolated from the power districts of northeastern Ontario as well as from southern Ontario. As the natural resources of the "Empire of the North" are further developed, it is expected that 60-cycle

power originating in this territory at the head of the lakes, will fan out like a creeping barrage through the development of 'middle-ground' power sites, linking up with Manitoba on the west and the northern Ontario properties to the east.

Developments and acquisitions associated with the present post-war construction program have already more than doubled the Commission's power resources in the Thunder Bay area. At the end of the War the Commission was operating only two generating stations in this district. These were the Cameron Falls and Alexander stations on the Nipigon River, with a total installed capacity of approximately 148,000 h.p. In October, 1948, a 53,000 h.p. development at Aguasabon on the north shore of Lake Superior about 150 miles east of Port Arthur was brought into service and tied in with Cameron Falls and Alexander. Early in 1949, the Commission acquired the system of the Kaministiquia Power Company, which was furnishing some 37,000 h.p. to the city of Fort William and neighbouring rural districts from its generating station at Kakabeka Falls. In June, 1950, the 80,000 h.p. Pine Portage development, designed for an ultimate capacity of 160,000 h.p., was brought into operation. Pine Portage is located on the Nipigon River above Cameron Falls and Alexander stations and will benefit with them from the splendid water storage afforded by Lake Nipigon. Through this large body of water, 10,000,000 acre-feet in extent, there is almost perfect regulation of flow, not only from the surrounding watershed but also from the Ogoki diversion, which will be remembered as a wartime achievement of the Commission, diverting southward into the Great Lakes system a river whose natural course linked it with the Albany River flowing northward into James Bay.

With the new power at its disposal, the Commission has been able to contemplate important extensions of its system not only in the Thunder Bay area proper but also in adjacent districts to the west.

Situated near Atikokan in the Rainy River district are the Steep Rock iron mines. In 1950, the Commission was in a position not only to serve this important industry with more power from its Nipigon River stations over a 115,000-volt transmission line built from Port Arthur some years ago, but also to undertake a further extension to the town of Dryden. According to plans, this extension, picking up consumers en route, would tie in with the circuits stemming from the Commission's Ear Falls station, which serves the towns of Dryden and Sioux Lookout as well as some 13 gold mines in the Patricia-Red Lake district. The capacity of Ear Falls was brought up to 25,000 h.p. by the addition of a 7,500 h.p. unit in 1948. Several other potential power sites on the English River are under investigation (August, 1950) and are estimated to have a combined capacity of about 248,000 h.p.

**Power Supply.**—While some of the framework for frequency standardization in the north has been laid, the vision is somewhat futuristic and planning has to be carefully attuned to development and economic expansion in that section of the Province. In southern Ontario standardization is an imperative need and, from the power-supply point of view as well as from the consumer change-over angle, it is being carried out with all possible dispatch.

From the 480,000 h.p. development at Des Joachims, two 230,000-volt transmission lines carry 60-cycle power to focal points such as Kipling, near Toronto, Burlington near Hamilton and Westminster near London, whence distribution is made to the areas where the change-over is proceeding. Through frequency-changer stations at Scarborough and Westminster some of this power can be made

available to the 25-cycle areas until the change-over to 60-cycle has advanced far enough to utilize it all. It is estimated that this stage will be reached by the end of 1951. It will then be a matter of obtaining additional supplies of 60-cycle power. Such supplies will be furnished from both hydro-electric and steam-electric stations.

The Commission's 160,000 h.p. Chenaux station on the Ottawa River about 75 miles below Des Joachims will be in full service by November, 1951, with initial power deliveries scheduled for December, 1950. Chenaux is connected with a new transformer station at Peterborough by a 230,000-volt transmission line, part of which was constructed several years ago in connection with other eastern Ontario power projects. From Peterborough the new 60-cycle power is carried over a 115,000-volt line to Oshawa and Scarborough, whence further distribution is effected as required. Initial services from the 192,000 h.p. La Cave development via Des Joachims are scheduled for January, 1952, with full service the following November. In addition, the 80,000 h.p. development at Stewartville on the Madawaska River has been available for general supply purposes in southern Ontario since its completion in 1948.

In addition there are steam-generating stations under construction at Toronto and Windsor. The 160,000 h.p. Windsor station is expected to be in full operation by December, 1951—one of its two units was brought into service late in 1950. One unit of the 268,000 h.p. Toronto station, to be brought into service initially at 25 cycles and later converted to 60 cycles, is scheduled for operation in November, 1951, and the other, a 60-cycle unit, in the February following.

These two stations are intended primarily to help meet the greatly increased demand for power in southern Ontario during the autumn and winter seasons, but they will be ready at need to serve any power supply purpose including that of frequency standardization.

**System Facilities and Intercommunication.**—The Commission's new 60-cycle system in southern Ontario is being equipped with the most up-to-date transmission and distribution facilities. Much of the new equipment was already installed when the Des Joachims station was brought into service in 1950.

The main arteries linking Des Joachims and La Cave to major distribution points comprise approximately 829 route miles, or 1,200 circuit miles of 230,000-volt line and about 62 route miles or 120 circuit miles of 115,000-volt line. Between Des Joachims and La Cave generating stations and Kipling and Westminster transformer stations, the 230,000-volt transmission lines included 2,243 single-circuit steel towers and 1,909 double-circuit steel towers. The total weight of these structures has been calculated at 40,190 tons. There were 3,606 wire miles of steel-reinforced aluminum cable conductors, each measuring in cross-section 795,000 circular mils, with a total weight of 10,386 tons. Protection against lightning was provided by 1,660 wire miles of 3/8 inch ground wire, with a total weight of 1,211 tons.

Manual and automatic telephones have been provided to serve the Des Joachims Generation Station. They inter-connect with the Minden Switching Station, 93 miles away and with the Chats Falls Generating Station, 106 miles distant, by means of telephone lines and telephone carrier channels superimposed on the power circuits. Communication facilities are also provided between Des Joachims and principal transformer stations and switching points by a similar utilization of the transmission lines. These facilities will be extended to the operation of the La Cave Generating Station when it is brought into service in 1952.

In addition to providing the means for oral communication, the carrier current channels convey the signals which isolate instantaneously from the system faulty power-line or equipment, indicate water levels and power loads and control the power frequency throughout the entire system so that electric clocks may keep accurate time and industrial machinery operate at constant speed. Radio is used for emergency communication with major operating centres throughout the southern Ontario system.

**Additional Proposed Developments.**—Realizing that frequency standardization would mean an even greater all-round use of electricity than had hitherto been experienced, the Commission, in 1950, was planning another major development at Niagara to be undertaken as soon as the necessary ratification of the project, which required the sanction of both the Canadian and United States Governments, could be obtained. This, it was estimated, would add 800,000 h.p. to the resources of southern Ontario. Other developments were in prospect in the northwestern section of the Province.

## Section 2.—The Central Electric Station Industry

An article dealing with government control of power in wartime is given at pp. 336-337 of the 1945<sup>1</sup> Canada Year Book.

**Summary of Energy Generated by Type of Station, 1947 and 1948.**—Central electric stations are companies, municipalities or individuals selling or distributing electric energy, whether generated by themselves or purchased for resale. Stations are divided into two classes according to ownership, viz., (1) commercial—those privately owned and operated by companies or individuals, and (2) municipal—those owned and operated by municipalities or Provincial Governments. These are subdivided according to the kind of power used into (a) hydraulic, (b) fuel, and (c) non-generating. This last sub-class purchases practically all the power it resells; a few of these stations have generating equipment that is held for emergencies. The hydraulic stations contain water turbines and wheels with approximately 88 p.c. of the total capacity of hydraulic installations in all industries in Canada: the generators driven by this hydraulic equipment generate 98 p.c. of the total output of all central electric stations.

### 5.—Electric Energy Generated, by Type of Station, 1939-46, and by Provinces, 1947 and 1948

## Subsection 1.—Statistics of Central Electric Stations\*

The growth of the central electric stations industry has been almost continuous since 1919, when statistics of kilowatt hours generated were first made available. The depression that occurred in the early 1930's resulted in decreased production of power during those years but output soon recovered. During the war years 1939-44 the equipment was used to maximum capacity, the output increasing by 42 p.c. from 1938 to 1944. Production declined slightly in 1945 but rebounded in 1946 to 102 p.c. of the 1944 figure. During 1947 a new record was established which was nearly equalled in 1948 and was surpassed in 1949 by nearly 4 p.c.

The central electric stations industry is one that is particularly suited to large-scale operations because of the huge outlays of capital necessary. Capital invested and total horse-power installed increased almost continuously even during the depression years, mainly because large power projects, planned before the depression, were in process of construction. Off-peak and surplus power, used mainly in electric boilers of pulp and paper plants, grew steadily to a peak of 7,803,000,000 kwh. in 1937 but, owing to war requirements for firm power, it was reduced during 1940-45, and soared to a new high of 8,067,489,000 kwh. in 1946. In 1947, secondary power consumption was reduced to 5,595,344,000 kwh. to 2,303,987,000 kwh. in 1948 as increased primary demand and low water levels left less available for off-peak use, and recovered to 2,839,940,000 kwh. in 1949.

## 6.—Summary Statistics of Central Electric Stations, 1939-48

NOTE.—Figures for the years 1917-31 will be found at p. 369 of the 1940 Year Book; for 1932-38 figures see p. 564 of the 1950 edition.

<sup>1</sup> Excluding duplications.  
after 1943.

<sup>2</sup> Not including auxiliary-plant equipment.

<sup>3</sup> Not collected

Although the amount of power used by domestic customers or for residential purposes is now only 10 p.c. of the total production of central electric stations, this service is exceedingly important. Details of the number of domestic customers served, the kilowatt hours delivered and the costs to the customers, exclusive of direct federal, provincial and municipal taxes on such service, are shown in Table 7. The average consumption per customer and average cost per kilowatt hour vary considerably as between municipalities and also as between provinces; there are smaller differences between the average bills. The average charge per kwh. is one of the lowest in any country.

\* Revised in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

## 7.—Summary Statistics of Domestic Consumption of Electricity, 1938-48

Year	Customers	Consumption	Average Consumption per Customer	Average Charge per Annum	Average Charge per kwh.

**Equipment of Central Electric Stations.**—Auxiliary equipment includes only thermal engines and generators operated by them in hydraulic stations and in non-generating plants and does not include spare equipment in thermal stations or spare hydraulic equipment in hydraulic stations. Such equipment is classed as main-plant equipment. The capacities of the equipment are the manufacturers' ratings and, for water wheels and turbines, the kilowatt hour capacities vary with the supply of water. The majority of the hydraulic stations are large, serving wide areas over transmission lines, whereas most of the plants with thermal engines are small, serving the needs of the local municipality. The number of thermal engines increased from previous years. Equipment data were not included for small plants, mainly in Saskatchewan and Alberta, whose output was largely consumed by their own industry or firm.

## 8.—Main-Plant Equipment of Central Electric Stations, by Provinces, and Total Auxiliary Equipment, 1948

NOTE.—Kva. means kilo-volt-amperes.

<sup>1</sup> Includes 30,690 kwh. in Yukon and Northwest Territories.

**Farm Service Furnished by Central Electric Stations.**—Table 10 shows the number of farm customers, the average annual consumption, average annual revenue and the average revenue per kilowatt hour sold to these customers in each province for 1948.

Effective Jan. 1, 1944, the Ontario Hydro-Electric Power Commission reclassified its rural customers, including under "farm customers" only farm contracts whereby one or more dwellings occupied by families engaged in the operation of the farm would be counted as one customer. This classification excluded other rural dwellings, stores, garages, repair shops, etc., also small properties of five acres or less except under special conditions. This change in classification explains the apparent decrease in farms served as shown in previous years, but by 1948 there were 90,869 farm customers in Ontario compared with 62,303 in 1944 and 66,686 on the former basis in 1943. The Ontario Government pays for part of the cost of installing service to farm customers, which accounts in part for the lower average revenue per kilowatt hour in Ontario as compared with the other provinces.

**Export and Import of Electric Power.**—Electric energy is exported from Canada only under licence and an export tax of 0.03 cents per kilowatt hour is levied with some exceptions. The export duties for the fiscal years ended Mar. 31, 1946 to 1949 were \$694,518, \$598,751, \$470,627 and \$435,867, respectively.

Exports for the years 1946-49 are shown in Table 11. There are also large interprovincial movements of electric energy from Quebec to Ontario, and smaller movements from Quebec to New Brunswick, Manitoba to Ontario, Saskatchewan to Manitoba and British Columbia to Alberta.

The water allowed to be diverted at Niagara Falls for power purposes was increased by 5,000 cu. ft. per second to the Canadian side in November, 1940, owing to a diversion of water from Long Lake and the Ogoki River from the James Bay watershed to the Great Lakes watershed. In 1941 a further increase of 9,000 c.f.s. to the Canadian plants and 12,500 c.f.s. to the United States plants was permitted, and in 1943 an additional 4,000 c.f.s. to Canadian plants bringing the totals up to 54,000 c.f.s. for Canada, and 32,500 c.f.s. for the United States. This increased water with greater development of plants on the St. Lawrence River made possible the increased export of both firm and secondary power to the United States (5,000 c.f.s. will produce about 150,000 h.p. at the Queenston, Ont., plant). During 1948 and 1949 increased demands from consumers and low water reduced the surplus energy available for export.

**Subsection 2.—Public Ownership or Regulation of Central Electric Stations\***

Water power is developed in Canada by provincial commissions, by municipalities and by private companies—hydro-electric plants. The first such provincial commission was formed in Ontario in 1906 to act as trustee for a group of municipalities to develop and distribute electricity. The Hydro-Electric Power Commission of Ontario now generates and purchases power, transmits it to rural and urban municipalities and serves large power customers. Similar commissions have been formed in most of the other provinces.

\* The information included under the provincial headings of this Subsection has been revised by the various provincial commissions or authorities concerned.

## 12.—Summary Statistics of Publicly Owned Central Electric Stations, 1939-48

Year	Power Plants	Customers	Electric Energy Generated	Power Equipment	
				Water Wheels and Turbines	Total
	No.	No.	'000 kwh.	h.p.	h.p.
1939.....	184	1,052,245	7,047,100	2,014,500	2,221,490
1940.....	181	1,088,415	7,822,013	2,022,285	2,227,203
1941.....	183	1,126,364	8,523,915	2,031,250	2,240,425
1942.....	188	1,140,499	9,177,792	2,134,845	2,344,310
1943.....	197	1,159,545	9,397,354	2,135,395	2,362,858
1944.....	202	1,484,784	14,910,198	3,092,295	3,340,268
1945.....	208	1,566,676	14,599,195	3,118,324	3,372,826
1946.....	203	1,650,739	14,739,271	3,274,484	3,523,463
1947.....	230	1,772,919	15,759,275	3,380,900	3,665,032
1948.....	242	1,884,642	16,692,388	3,632,636	3,993,323

A large portion of the power development in Quebec is connected with pulp and paper plants and with the aluminum industry. Such power plants are operated as separate organizations and deliver power to the parent companies at relatively low rates. Also, substantial blocks of power are produced in Quebec for export to Ontario.

Table 13 shows statistics of municipally or publicly owned central electric stations, by provinces, for 1948. Table 24 at p. 569 shows comparable statistics for commercial stations.

## 13.—Publicly Owned Central Electric Stations, by Provinces, 1948

Province or Territory	Power Plants	Customers	Electric Energy Generated	Power Equipment	
				Water Wheels and Turbines	Total
	No.	No.	'000 kwh.	h.p.	h.p.
Prince Edward Island.....	1	1,860	4,320	—	2,590

<b>Totals.....</b>	<b>242</b>	<b>1,884,642</b>	<b>16,692,388</b>	<b>3,632,636</b>	<b>3,993,323</b>

Because of the absence of free market determination of prices and regulation of services in an industry that is semi-monopolistic, regulation of electrical utilities has been attempted in most provinces. The governing bodies of the provincial electric power commissions, their functions and activities are summarized by provinces in the following paragraphs.

**Newfoundland.**—The available hydro power on the Island of Newfoundland alone is placed at well over 1,000,000 h.p. No figures are available for Labrador but substantial water resources are known to exist.

Installed turbine capacity at the end of 1949 was nearly 262,050 h.p.; 83,400 h.p. was utilized by the Anglo-Newfoundland Development Company, Limited, in the manufacture of pulp and paper and in supplying light and power to Grand Falls and the towns of Bishop's Falls, Botwood and small adjacent centres. The Company's power plant is located at Grand Falls on the Exploits River; 156,000 h.p. was developed by Messrs. Bowater's Newfoundland Pulp and Paper Mills, Limited, at their power plant which is erected on the south side of Deer Lake. This Company, in addition to utilizing power for their own requirements in the manufacture of pulp and paper and furnishing light and power to Corner Brook and adjacent communities, supplies light and power to the Buchans Mining Company and light and power to several small municipalities in the Humber area. The remainder was distributed among four other privately owned Companies, the largest being the Newfoundland Light and Power Company which supplies light and power to the city of St. John's and to the town of Bell Island, also for the iron mining operations there. This Company developed 21,350 h.p. from four plants. The United Towns Electric Company, with 16,710 h.p. from eight plants, supplies light and power to communities on the Avalon Peninsula, to the fluorspar mining operations on the Burin Peninsula, and to communities on the West Coast. There are no publicly owned systems.

Frequency used is 60 cycles except in areas served by the pulp and paper companies where 50 cycles prevails with original machinery from England.

A considerable number of home-lighting plants and small generators are in use in most of the scattered outposts despite the proximity of water power.

**Nova Scotia.**—In 1909 legislation was first enacted in Nova Scotia relating to the use of water power in "An Act for the Further Assistance of the Gold Mining Industry".

This was the most advanced legislation until the development of water power within the Province of Nova Scotia was initiated under Acts of 1914 and carried on in an investigatory manner in co-operation with the Federal Government until 1919, when the Nova Scotia Power Commission was created under the Power Commission Act. Certain investigatory work is still carried on in Nova Scotia by the Federal Government through the Dominion Water and Power Bureau with which the Nova Scotia Power Commission is closely associated. The control of the water resources of the Province is vested in the Crown and administered under the provisions of the Nova Scotia Water Act of 1919. The Commission pays the regular fees for water rights.

The function of the Commission is the supply of electric power and energy by the most economical means available. The Rural Electrification Act of 1937 greatly increased the possibilities for retail service. It provides for financial assistance to equalize cost and revenue of extensions, the construction of which has

been approved by the Governor in Council as qualifying under the Act. In 1941, an amendment to the Power Commission Act authorized the Commission, subject to the approval of the Governor in Council, to regulate and control the generation, transmission, distribution, supply and use of power in the Province.

Financially, the Commission is self-supporting, repaying borrowings from revenue. The balance sheet at Nov. 30, 1949, showed total fixed assets of \$25,601,226, including work in progress amounting to \$2,189,270. Current assets amounted to \$231,707. Liabilities are shown as follows: fixed \$18,888,483; current \$2,590,234; contingency and renewal reserves \$2,552,361; sinking fund reserves \$4,060,776; and general reserves and special reserves \$1,689,666.

The initial development of the Commission was an 800 h.p. installation on the Mushamush River which went into operation in 1921 and delivered 192,000 kwh. in the first complete year of operation. Succeeding years showed a marked increase in growth reaching an installed capacity of 80,850 h.p. in hydraulic turbines, 724 h.p. in diesel units and 1,125 kw. in steam turbines by Nov. 30, 1949, with a total generation for that year of 262,482,108 kwh.

The territory of the Commission extends the entire length of the Province and embraces nine systems which include 20 generating stations and 3,077 miles of transmission and distribution lines, through which 39 wholesale and 18,956 retail customers received 248,724,341 kwh, during the fiscal year ended Nov. 30, 1949.

Deep Brook hydro-electric development with an installation of 12,000 h.p. started operation about July 1, 1950, and a steam plant in Pictou County with an initial installation of 10,000 kw., under construction, will go into commercial operation about January, 1951, making a substantial addition to the total installation.

The installed capacity and annual output of the various systems of the Nova Scotia Power Commission are given in the following table.

#### 14.—Capacity and Output of The Nova Scotia Power Commission, 1949

Systems	First Year of Operation	Installed Capacity		Annual Generation	
		Initial	1949	Initial	1949
		h.p.	h.p.	kwh.	kwh.

<sup>4</sup> Rated in kilowatts.

**New Brunswick.**—The New Brunswick Electric Power Commission was incorporated under the Electric Power Act, 1920. Generating stations owned and operated by the Commission are as follows:—

<u>Plant</u>	<u>Type</u>	<u>Capacity</u> h.p.
Musquash.....	Water power.....	10,000
Kouchibouguac.....	Water power.....	200
Grand Lake.....	Steam.....	26,800
Saint John.....	Steam.....	25,500
Chatham.....	Steam.....	16,750
Grand Manan.....	Diesel.....	645
St. Quentin.....	Diesel.....	550
St. Stephen.....	Diesel.....	3,300
Campobello.....	Diesel.....	335
Andover.....	Diesel.....	535
Shippegan.....	Diesel.....	2,680
TOTAL CAPACITY.....		87,295

The Musquash Grand Lake, Saint John, Chatham and Kouchibouguac plants are inter-connected and operate in parallel at all times.

In 1949, the New Brunswick Electric Power Commission completed a 69,000-volt line from Musquash to St. Stephen with a tap line to McAdam. High voltage transmission was thereby increased from 476 miles in 1948 to 566 miles in 1949. Power is sold "en bloc" to the cities of Saint John, Moncton, Fredericton and the town of Sussex.

The statistical information given in Table 15 shows the growth of the Commission's undertakings since 1924.

**15.—Growth of the New Brunswick Electric Power Commission, Years Ended Oct. 31, 1924, and 1945-49**

**Quebec.**—*The Quebec Streams Commission.*—Created in 1910 by 1 Geo. V, c. 5, and given additional powers by 3 Geo. V, c. 6 (R.S.Q., c. 46) and by 20 Geo. V, c. 34, the Commission was authorized to ascertain the water resources of the Province, to make recommendations regarding their control, and to construct certain storage dams and operate them so as to regulate the flow of streams. The Commission has assisted companies engaged in such work by the systematic collection of data on the flow of the principal rivers and on meteorological conditions, by investigation of numerous water-power sites and determination of the longitudinal profile of a large number of rivers, but mainly by the regulation of the flow of the principal power streams through the construction of storage dams.

From 1912 to 1925, a number of storage reservoirs were built or acquired by the Commission, charges being made to benefiting companies to cover interest and amortization on the capital invested as well as the cost of operation. Since 1925,

companies or persons have availed themselves of the latitude given them by R.S.Q. 1925, c. 46, to build the necessary dams; such storages have been transferred to and are operated by the Commission, the cost of operation only being charged annually to the interested companies or persons. In all, the Commission now controls and operates 28 storage-reservoirs in the Province.

Among the rivers controlled by the Commission, either by means of dams on the rivers themselves or by controlling the outflow of lakes at their headwaters, are: the St. Maurice, now developing 1,110,550 h.p.; the Gatineau, 528 000 h.p.; the Lièvre, 274,000 h.p.; the St. Francis, 100,000 h.p.; the Chicoutimi, 41,400 h.p.; the Au Sable, 33,200 h.p.; and the Metis, 15,700 h.p. The Commission also operates nine reservoirs on Rivière du Nord, two in the watershed of Ste. Anne-de-Beaupré River, and one at the outlet of Lake Morin, on Rivière-du-Loup (en bas).

*Reservoirs not Controlled by the Quebec Streams Commission.*—Among storage-reservoirs not controlled or operated by the Commission are: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River, and the Onatchiway on the Shipshaw River; the Témiscouata Lake on Madawaska River, controlled by the Gatineau Power Company; Memphremagog Lake on the Magog River, controlled by the Dominion Textile Company; Témiscamingue and Quinze Lakes on the Ottawa River, controlled by the Federal Department of Public Works; Kipawa Lake on the Ottawa River, controlled by the Canadian International Paper Company; Dozois Lake on the Upper Ottawa River, controlled by the Quebec Hydro-Electric Commission.

Power developments on the Saguenay River, benefiting from the Peribonca and Lake St. John reservoirs, amount to 1,950,000 h.p. since the Chute-à-Caron (Shipshaw) project has been completed.

*The Quebec Hydro-Electric Commission.*—The Quebec Hydro-Electric Commission was established by 8 Geo. VI, c. 22, with the object of supplying power to the municipalities, industrial or commercial undertakings and citizens of the Province of Quebec at the lowest rates consistent with sound financial administration.

On Apr. 15, 1944, in accordance with the provisions of this Act, the Commission took over: (a) the system of Montreal Light, Heat and Power Consolidated for the generating and distributing of electricity; (b) the undertaking of the Montreal Island Power Company for the generating and distributing of electricity; and (c) all the shares of the capital stock of the Beauharnois Light, Heat and Power Company. Thus, the Quebec Hydro-Electric Commission acquired the control, among other assets, of the following hydro-electric plants:—\*

<i>Hydro-Electric Plant</i>	<i>River</i>	<i>Installed Capacity</i>
Cedars.....	St. Lawrence.....	200,000 h.p.
Chambly.....	Richelieu.....	9,000 h.p.
Sault-au-Recollet.....	Rivière-des-Prairies.....	45,000 h.p.
Beauharnois.....	St. Lawrence.....	730,000 h.p.

The Commission operates a public utility system which supplies electric light and power requirements to Greater Montreal and surrounding districts embracing a population of nearly 1,500,000. From the Cedars plant, electric energy is supplied

\* The Commission also purchases 160,000 h.p. from the Shawinigan Water and Power Company.

to the Aluminum Company of America at Massena, N.Y., and through Beauharnois Light, Heat and Power Company power is sold to the Hydro-Electric Power Commission of Ontario. Sales involved are in the neighbourhood of rates of 100,000 h.p. to Massena, N.Y., and 250,000 h.p. to Ontario.

#### 16.—Growth of the Quebec Power Systems, 1940-49

NOTE.—Figures for the years 1935-39 will be found at p. 572 of the 1950 Year Book.

Year	Municipalities Served	Customers Served	Power Distributed	
			Total	Primary
	No.	No.	h.p.	h.p.
1940.....	61	281,027	806,000	699,000
1941.....	61	285,648	892,000	784,000

Beauharnois Local System.....	77,000	27,000	34,000	35,000	36,000	70,000
Beauharnois 25-cycle System (H.E.P.C. of Ontario).....	250,000	250,000	250,000	250,000	250,000	250,000
Massena System.....	104,000	94,000	125,000	128,000	128,000	130,000
<b>Totals.....</b>	<b>897,000</b>	<b>883,000</b>	<b>947,000</b>	<b>980,000</b>	<b>1,034,000</b>	<b>1,119,000</b>

In addition to the ownership and operation of these generating and distribution systems, the Quebec Hydro-Electric Commission administers the 64,000 h.p. Upper Ottawa River plant at Rapid VII and also the Dozois Reservoir. Average primary power statistics for this Northern Quebec System (Cadillac-Noranda district) are as follows: 1944, 16,820 h.p.; 1945, 14,720 h.p.; 1946, 15,750 h.p.; 1947, 18,140 h.p.; 1948, 21,270 h.p.; and 1949, 34,790 h.p.

**Ontario.**—*The Hydro-Electric Power Commission of Ontario.*—An account of the inception and operations of the Commission is given at pp. 377-378 of the 1940 Year Book.

Since 1945 the Commission has been engaged in implementing the power development program for which plans were started before the termination of the Second World War. In addition the Commission is at present engaged upon an extensive program of frequency standardization in the southern areas of the Province.

In Section I of this Chapter will be found a special article describing the planning and execution of the change-over from 25 cycles to 60 cycles. The following statements show the existing power resources of the Commission as at Oct. 31, 1949, and a summary of the post-war development program, 1945-1952.

I.—TOTAL POWER GENERATED AND PURCHASED—ALL SYSTEMS, YEAR ENDED OCT. 31, 1949

<sup>1</sup> Ultimate capacity planned—192,000 kilowatts, 257,000 horsepower.

<sup>2</sup> Ultimate capacity planned—

120,000 kilowatts, 160,000 horsepower.

*Hydro-Electric Power Commission Statistics.*—The Annual Reports of the Commission present, in detail, descriptions and statistics of operation, construction municipal work, transmission and distribution. The Commission exercises supervisory functions over the electrical utilities owned and operated by the partner municipalities.

The Commission was established by special Acts of the Provincial Legislature in 1906 and 1907. In 1909 a comprehensive transmission system was commenced and by the end of 1910 power was being supplied to several municipalities. The initial capital expenditure required for this purpose was approximately \$3,600,000. At Oct. 31, 1949, the total capital investment amounted to \$869,955,377, of which \$695,523,039 represented investments by the Commission in generating plants, transmission systems, etc., operated by the Commission for the major systems under its control; \$174,432,338 represented investments by municipalities in local distributing systems of their own, including other assets. Similarly, total reserves of the Commission and of the municipal electric utilities for sinking funds, renewals, contingencies and insurance purposes amounted to \$533,135,810, of which \$372,843,390 represented reserves of the Commission and \$160,292,420 represented reserves and surplus of the municipal electric utilities.

#### 18.—Growth of The Hydro-Electric Power Commission of Ontario, Years Ended Oct. 31, 1940-49

NOTE.—Figures for the years 1931-39 will be found at p. 594 of the 1950 Year Book.

Year	Municipalities Served	Customers Served	Total Power Distributed	Capital of Commission and Assets of Municipal Utilities
	No.	No.	kw.	\$

<b>Totals.....</b>	<b>1,939,505</b>	<b>1,935,972</b>	<b>2,003,139</b>	<b>1,887,317</b>	<b>2,150,231</b>

*Statistics of Urban Municipal Electrical Utilities of Ontario Served by the Commission.*—In the 1949 Annual Report of the Commission detailed consolidated balance sheets and operating reports are given for the 315 urban electrical utilities served.

The balance sheet shows that the total plant value has increased from \$10,081,469 in 1913 to \$136,745,779 in 1949, and the total assets from \$11,907,827 to \$274,484,001. The liabilities have not increased in the same proportion as the assets, rising from \$10,468,352 to a maximum of \$52,685,317 in 1932, and receding to \$14,139,918 in 1949, due to the regular fulfilment of debt retirement schedules under serial debenture provisions or by maturity of sinking funds, and because cost of the increasing plant value has been financed mainly out of reserves and surplus without increasing the capital liabilities of the respective utilities.

The operating report for 1949 shows that of the 315 municipal electrical utilities included in this statement, 306 received from consumers sufficient revenue to meet all operating expenses, interest, debt retirement instalments and standard depreciation reserve allocation, and to yield an aggregate net surplus of \$3,251,849 for the year; the other nine utilities were able to defray out of revenue all such charges, except \$55,160 of the standard depreciation allocation.

*Rural Electrical Service in Ontario.\**—During past years substantial progress has been made in Ontario in the field of rural electrification, and the Commission's rural operations are now an important feature of its work. The Ontario Government, pursuant to its policy of promoting agriculture contributes, in the form of 'grants-in-aid', 50 p.c. of the initial capital cost of distribution lines and equipment.

*Uniform Rural Rate Structure.*—A uniform rural rate structure, for the sale of energy, became effective Jan. 1, 1944, for all rural Hydro service in Ontario.

Whereas this uniform structure has been maintained, the energy rates were changed in 1945 and 1950 so that beginning May 1, 1950, the energy rates consist of the following three-step energy charge:—

- (1) A first block or number of kilowatt-hours of energy consumption in the billing period, charged for at 4·4 cents gross per kwh.;
- (2) a second block or number of kilowatt-hours of energy consumption in the billing period, charged for at 2·1 cents gross per kwh.; and
- (3) all remaining kilowatt-hours of energy consumption in the billing period, charged for at 1·1 cents gross per kwh.

In addition, the service charge in use prior to Jan. 1, 1944, has been eliminated in the case of farm, commercial and hamlet service. Summer service carries an annual service charge in addition to the energy charge.

*Farm Rate.*—More than 95 p.c. of the farms receiving Hydro service are served at the minimum demand rating for billing purposes of 3 kw. This is a three-wire service with a breaker or fuse rating of 35 amperes on each side of the neutral. The first energy rate of 4·4 cents per kwh. applies to the first 60 kwh. per month. The second energy rate of 2·1 cents per kwh. applies to the next 180 kwh. per month. For all remaining energy consumption in the billing period the rate is 1·1 cents per kwh. The minimum bill is \$2·25 per month. A prompt payment discount of 10 p.c. is made on the total bill.

\* Legislation passed concerning rural power is as follows: the Power Commission Act (R.S.O. 1937, c. 62); the Rural Hydro-Electric Distribution Act (R.S.O. 1937, c. 64); and the Rural Power District Service Charge Act (R.S.O. 1937, c. 66).

**Manitoba.**—The Manitoba Power Commission commenced its operations in 1919 under the authority of the Electrical Power Transmission Act. This Act empowered the Commission to make provision for generating electric energy, to enter into contracts for the purchase of power in bulk from generating agencies, and for its transmission and sale to municipalities, corporations and individuals. The first stretch of transmission line was completed in 1920 from Winnipeg to Portage la Prairie.

For the first ten years power was purchased in bulk from the Winnipeg Hydro-Electric System. At the expiration of this period, the Seven Sisters Agreement between the Manitoba Government and the Winnipeg Electric Company provided for the reservation of a block of power for the Power Commission.

The Manitoba Power Commission Act of 1931 provided for the reorganization of the utility's administration. Bulk contracts were cancelled and service begun direct to the consumer, municipalities and towns having contracts for street lighting only. This made possible the adoption of a policy by which the Commission might eventually establish standard rates for all towns and villages regardless of distance from the source of supply or the sparseness of population.

The expansion of the utility since 1931 shows the importance of this reorganization. In 1931 there were 56 cities, towns and villages on the System; 281 communities were served in 1948. Revenues increased from \$700,000 to over \$3,284,000. Rate reductions, meanwhile, have reduced the average customer cost per kilowatt-hour by 50 p.c.

The successful growth of the network to the majority of the cities, towns and villages of the Province, made it possible for the Commission to consider a project of extending electric service to the farms. The Manitoba Electrification Enquiry Commission appointed by the Provincial Government in 1942 to study farm electrification in the Province, reported electric service could be brought to at least 90 p.c. of the farms in the Province. Previously, individual or small groups of farms situated near existing low voltage transmission lines were connected on a contributory basis.

Construction under the farm program began on an experimental basis in 1945 when transmission lines were built to serve 674 farms in seven test areas. Under the farm electrification program the Commission bears the expense of building the power line right into the farm-yard, the farmer being responsible for his yard and interior wiring, and for the purchase of appliances. Post-war shortage of line materials restricted this program to 1,500 farms in 1946 and 3,500 in 1947. Substitution of

Manitoba jack-pine poles and the establishment of a transformer factory and the development of miscellaneous pole-line hardware manufactures in the Province, enabled the Commission, in 1948, to return to the original plan of electrification of 5,000 farms annually; on completion of the 1950 construction, 22,000 farms will be receiving electric service.

In conjunction with farm electrification, a program, by which electric service is extended to every community located within the practical service area of the Province and having a population of at least 20, is nearing completion. On this basis, 197 towns, villages and hamlets, have received electric service since the program was recommenced after the War. On completion of the 1950 construction program, 391 communities will be supplied by the Manitoba Power Commission.

**Saskatchewan.**—The Saskatchewan Power Commission was established in 1929 under the Power Commission Act (R.S.S. 1940, c. 33), which authorized the Commission to manufacture, sell and supply electric energy, to acquire and develop water-power sites, to acquire or construct oil and steam plants, to construct transmission lines, to purchase power and to enter into contracts for the supply of electric energy.

During the years 1929 to 1945, the Commission purchased certain generating plants, and constructed and purchased transmission lines and also distribution systems in towns and villages. These were improved, enlarged or supplemented. Particulars of these acquisitions and constructions are given in the 1941 Year Book and subsequent editions.

On Jan. 1, 1947, Dominion Electric Power, Limited, which for a time had been operated as a wholly owned subsidiary, was completely absorbed by the Commission, and the properties of Canadian Utilities, Limited, in Saskatchewan, with the exception of its Lloydminster plant, were added to the Commission's system.

The Commission at the end of 1948, owned and operated 4,190 miles of transmission line and distribution systems in 375 cities, towns and villages served by the system.

On Feb. 1, 1949, under the terms of the Crown Corporations Act, 1947 (c. 13), Saskatchewan Power Corporation took over the assets and assumed the obligations of the Saskatchewan Power Commission. A number of the provisions of the Power Commission Act continued to be applicable to the Corporation, which is a body corporate, consisting of members appointed by the Lieutenant Governor in Council. On Apr. 8, 1950, the Power Corporation Act, 1950, was passed (c. 10), continuing Saskatchewan Power Corporation in existence, and the Power Commission Act was repealed. The main functions of the Corporation are the generation, transmission, distribution, sale and supply of electrical energy and steam; the production or purchase, and the transmission, distribution, sale and supply of natural or manufactured gas.

On the passing of the Power Corporation Act, 1950, and the repeal of the former Power Commission Act, a new Power Commission Act, 1950, was passed (c. 9) under which certain powers of control and regulation over electrical utilities, as well as gas utilities, were vested in the Saskatchewan Power Commission, which consists of one or more persons appointed by the Lieutenant Governor in Council for the purposes of the Act.

At the end of 1949, the Corporation owned and operated 4,592 miles of transmission line, having built 402 miles during the year, and also owned and operated distribution systems in 422 cities, towns, villages and hamlets, 47 of these systems

having been added during the year. The Corporation also owned and operated steam generating plants located at Estevan, North Battleford, Prince Albert, Saskatoon and Taylorton, with a total installed capacity of 63,950 kw. At the end of the same year the Corporation owned and operated diesel plants located at Assiniboia, Biggar, Canora, Davidson, Eastend, Grenfell, Hudson Bay, Humboldt, Kindersley, Leader, Maple Creek, Meadow Lake, Melfort, Melville, Moosomin, Nipawin, Perdue, Rosetown, Shaunavon, Shellbrook, Swift Current, Tisdale, Unity, Watrous, Wynyard and Yorkton, with a total installed capacity of 30,435 h.p. The Corporation also purchased blocks of power from outside sources.

Electrical energy is sold retail direct to consumers, except in or to municipal corporations and retailed by them to the consumers. The number of customers served direct at the end of 1949 (including rural services) was 57,855, while the number served by municipalities buying power in bulk from the Corporation was approximately 20,574.

In the year 1949, the Corporation installed additional capacity in its diesel plants at Canora, Hudson Bay, Watrous and Yorkton. Transmission lines constructed during the year included: a high tension line from Estevan to Yorkton; a line from Yorkton to Canora; a line from Estevan to Bienfait; a line from Regina to Pense, to interconnect the Moose Jaw and Regina 24,000-volt systems; a line from Lebret to Balcarres; and another from Eston to Kindersley, with an extension to serve Eaton, Laporte and Glidden.

The Power Corporation has commenced its program of rural electrification under the provisions of the Rural Electrification Act, 1949. This Act provides for the supply of power to rural customers by means of lines owned by the Saskatchewan Power Corporation, either in rural power districts or to individuals or small groups not within rural power districts. Bulk supply of power is provided also by the Corporation to rural power co-operative associations.

The cities of Regina and Weyburn as well as certain towns and villages own and operate their municipal plants and distribution systems. In Moose Jaw and in a number of small towns and villages, local plants and distribution systems are owned and operated by private companies or individuals.

## 21.—Growth of the Saskatchewan Power Commission, now Saskatchewan Power Corporation, 1940-49

NOTE.—Figures for the years 1929 to 1933 inclusive will be found at p. 499 of the 1947 Year Book. Figures for the years 1934 to 1939 inclusive will be found at p. 573 of the 1950 Year Book.

Year	Municipalities Served		Customers Served		Total Power Generated	Total Power Purchased	Capital

Control and regulatory powers regarding franchises for the supply of electric energy and the rates to be charged therefor are conferred upon the Local Government Board by Part III of the Public Utilities Companies Act (R.S.S. 1940, c. 118).

**Alberta.**—Public ownership of power-generating and distributing systems in Alberta is confined to certain urban municipalities. The regulatory authority over privately owned systems is the Board of Public Utility Commissioners, which has jurisdiction over the distribution and sale of electricity. The Board has power to hold investigation upon complaint made either by a municipality or by a utility company and, following such investigation, may fix just and reasonable rates.

There are three private utility services in the Province; Calgary Power, Limited, Canadian Utilities, Limited, and Northland Utilities, Limited. A short synopsis of these services is given below.

*Calgary Power, Limited.*—This Company has five hydro-generating plants on the Bow River and its tributaries, west of Calgary. These plants are: the Horseshoe Falls; Kananaskis Falls; Ghost River with a storage reservoir capacity of 74,000 acre-feet of water; Cascade and Barrier plants, total 105,000 h.p., which capacity will be increased to almost 200,000 h.p. when Spray—now under construction—is completed. The Barrier plant, completed in 1947, is operated by remote control. In addition to the Ghost storage, the Company has reservoirs at Lake Minnewanka and the Upper Kananaskis Lake, and another at Spray Lakes under construction.

Power from these plants together with that received under interchange agreements with the cities of Lethbridge and Edmonton, the East Kootenay Power Company, Limited, and the 14,000 h.p. steam plant at Calgary, is fed into a transmission network which supplies the entire electrical requirements of the cities of Calgary and Red Deer, and 180 towns, villages and hamlets in central and southern Alberta. Calgary Power, Limited, transmission system, comprising 4,000 miles of lines of all voltages, extends from the International Boundary to Westlock, 60 miles north of Edmonton, and in the central part of the Province extends west to the Brazeau coal fields at Nordegg and east to Macklin, Sask. Calgary and Lethbridge and the towns of Ponoka, Macleod and Cardston are supplied upon a wholesale basis and own their own distribution systems. All other points upon the system are supplied on a retail basis.

The Company has 3,800 miles of transmission lines and 431 miles of distribution lines. An extensive farm electrification program is in progress and, at Apr. 1, 1949, the Company was supplying approximately 4,000 farms. Under a co-operative arrangement, 2,500 to 3,000 farms will be added each year in this program, the Company doing all engineering, construction and operation through a non-profit subsidiary, energy being supplied to the farm co-operative customers at cost. Alberta's sparse farm population presents an enormous problem to a farm electrification program of any type.

The Company's transmission systems are designed with a view to future expansion. Expansion of power generating facilities is also under way. The Spray Lakes project, scheduled for completion in 1950, will develop ultimately a total of 89,000 h.p., the largest hydro installation in the Province. Immediate construction of two hydro plants, to be known as Spray and Three Sisters, will add 62,000 h.p. and 3,600 h.p., respectively. The third, the Rundle plant, is a future project and will have a capacity of 23,000 h.p. Five dams will impound water in three storage reservoirs, developing a total head of 1,285 ft. when the system is complete.

*Canadian Utilities, Limited.*—Towns and villages northeast of Drumheller are supplied from a 13,500 kw. steam plant in that city by Canadian Utilities, Limited, while towns and villages north and east of Vegreville are served from a new gas-fired 7,500 kw. steam plant at Vermilion. There are also diesel stand-by plants at Lloydminster and a tie-line with Calgary Power, Limited, near Holden. This utility also serves the areas around Grande Prairie from a 2,300 h.p. diesel-engine plant located in that centre. The Company serves over 16,000 customers, in approximately 100 towns, villages and hamlets in the Province, through a network of approximately 1,080 miles of transmission lines.

In 1949, the Company embarked on a program of extending its lines to farmers on a co-operative basis. Energy is supplied at the individual meters at 2 cts. per kilowatt hour and the Company also collects from the farmers \$3.50 per month, against which it charges the operating and depreciation costs involved. In effect, the system is constructed and operated at cost for the farmer.

*Northland Utilities, Limited.*—This Company, with headquarters at Edmonton, supplies electric energy to 4,450 consumers in 22 northern communities. Diesel generating plants are located at Jasper, Mayerthorpe, Athabasca, High Prairie, McLennan, Peace River and Chauvin. Low-voltage transmission lines extending from these generating stations supply electricity to 120 farms and 13 villages.

In addition to the diesel generating stations, the Company, in 1948, constructed a 665 kva. hydro plant on the Astoria River in Jasper National Park for the Department of Mines and Resources. The Company also serves the communities of Dawson Creek, Pouce Coupé and Rolla in the Peace River Block of British Columbia.

*Other Privately Owned Utilities.*—Edmonton generates power from coal and operates its own distribution system; in addition, there is a reciprocal arrangement with Calgary Power, Limited, for exchange of power at peak periods. Calgary, Red Deer, Lethbridge, Macleod, Cardston and Ponoka own their distributing systems but purchase power from Calgary Power, Limited. Medicine Hat owns a power plant and distribution system and furnishes power to the adjacent town of Redcliff. Villages and hamlets beyond the reach of the large utility companies are served by small privately owned power plants.

**British Columbia.**—The British Columbia Power Commission was appointed Apr. 17, 1945, under the provisions of the "Electric Power Act"—"an Act to provide for improving the availability and supply of electric power". Actual operations, however, were not commenced until August, 1945, with the acquisition of electrical properties in several parts of the Province. The following table shows the growth in number of customers up to the end of March, 1950:—

<i>Period Ended Mar. 31—</i>	<i>Services Acquired</i>	<i>Services Installed</i>	<i>Total Services for Period</i>	<i>Cumulative Services to End of Period</i>
	No.	No.	No.	No.
1946.....	13,270	832	14,102	14,102
1947.....	7,151	1,786	8,937	23,039
1948.....	1,000	3,431	4,431	27,470
1949.....	831	3,318	4,149	31,619
1950.....	4,686	3,321	8,007	39,626
TOTALS.....	26,938	12,688	39,626	135,856

This growth has been accompanied by a corresponding increase in generating capacity. At Mar. 31, 1946, the capacity of acquired plants totalled 10,355 kva. During the next four years the generating capacity was increased by 111,500 kva.

reaching 121,855 kva. by Mar. 31, 1950. In the same period the number of power districts rose from 12 to 23. There was also a large increase in the line mileage in operation. Further expansion is contemplated during 1950.

In 1946 the Commission established a promotional rate structure designed to "permit and encourage the maximum use of power" as required by the Act. This rate structure has been extended as fast as increased plant capacity and distribution systems are installed to take care of the growth in load anticipated through its introduction. Promotional rates had by June, 1950, been adopted in 20 out of the 24 operating power districts.

The second phase of the Commission's main development on Vancouver Island—the John Hart plant—was inspected and officially declared completed by the Premier of British Columbia on Oct. 21, 1949. The capacity of this plant, designed for an ultimate capacity of over 200,000 h.p., is now 112,000 h.p. This plant supplies power to much of the territory north of Duncan over a 104-mile, 132,000-volt transmission line. This area will be enlarged when the Comox Valley, now being served through the purchase of 25-cycle power from the Canadian Collieries, Limited, plant at Puntledge, is converted to 60 cycles, which program is already underway. With the B.C. Electric Railway Company, Limited, contracting for a large block of this power for distribution in Victoria and environs, delivery to commence in the late summer of 1950, the John Hart Development will be serving all main portions of Vancouver Island. The development has brought two major industrial loads to the area.
